gateway, in addition to adding more functions provided for by the query engine into the gateway.

The Go4zgate gateway allows the Gopher Client to:

- Request Z39.50 based queries from a Z39.50 server.
- Retrieve and display the records which were returned by the server.

The gateway is available via anonymous ftp from

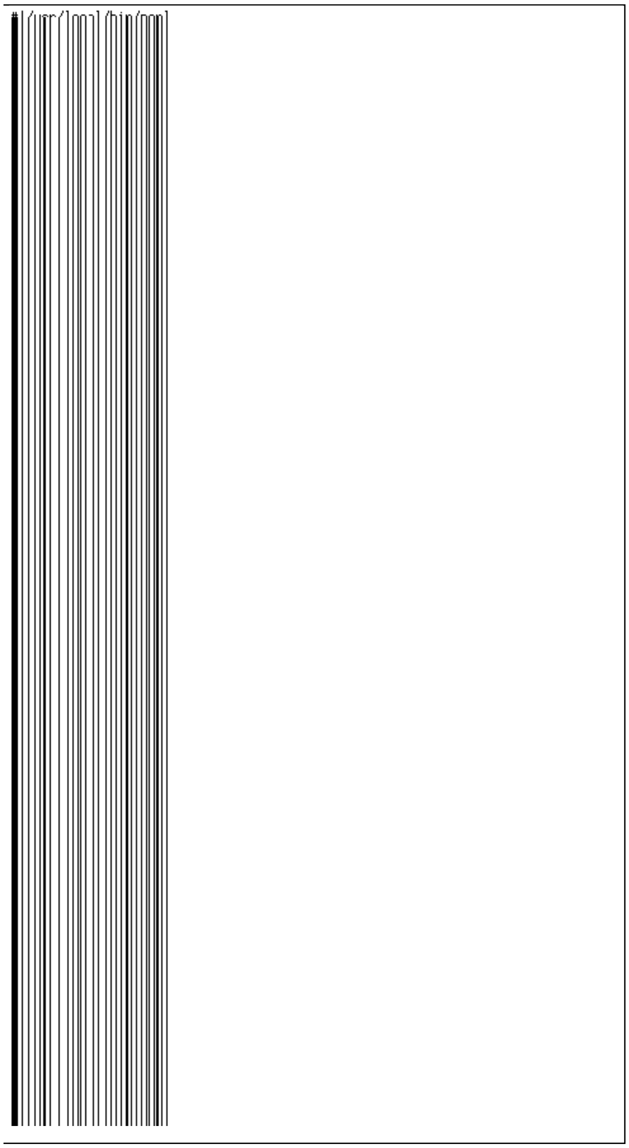
> boombox.micro.umn.edu

via anonymous ftp from the directory

> /pub/gopher/Unix/gopher-gateways/go4zgate

Included in this distribution are some sample ASK blocks that define the form users are presented with. Also included is this document.

Completed the Form?



```
#!/usr/local/bin/perl
```

The above code is a perl script which processes the information entered into the form. As you can see Operator is preset to an AND operation. Included in this script are preset values for Host (which is set to melvyl.ucop.edu for this particular form), the Catalog, and the Z39.50 port (Port). On thing to note, most servers will be listening to Z39.50 requests on port 210, but this may not always be so.
