ABSTRACT. We prove: If r_1, \dots, r_k are (fixed) positive real numbers with $\prod_{j=1}^k r_j > 1$, then the only entire solutions $\varphi: \mathbb{C} \rightarrow \mathbb{C}$ of the functional inequality

$$\prod_{j=1}^k |\varphi(r_j z)| \geq \left(\prod_{j=1}^k r_j \right) |\varphi(z)|^k$$

are $\varphi(z) = cz^n$, where c is a complex number and n is a positive integer.

KEY WORDS AND PHRASES. Functional inequality, entire functions.

1991 AMS SUBJECT CLASSIFICATION CODE. 39C05.

1. INTRODUCTION.

Inspired by a problem of H. Haruki, who asked for all entire solutions of

$$|\varphi(z+w)|^2 + |\varphi(z-w)|^2 + 2|\varphi(0)|^2 \geq 2|\varphi(z)|^2 + 2|\varphi(w)|^2, \quad (1.1)$$

J. Walorski [1] proved in 1987 the following interesting proposition:

Let $r > 1$ be a (fixed) real number. Then the only entire solutions $\varphi: \mathbb{C} \rightarrow \mathbb{C}$ of the functional inequality

$$|\varphi(rz)| \geq r |\varphi(z)|$$

are

$$\varphi(z) = cz^n, \quad (1.2)$$

where $c \in \mathbb{C}$ and $n \in \mathbb{N}$.

As an application of this theorem, Walorski showed that the only entire functions $\varphi: \mathbb{C} \rightarrow \mathbb{C}$ satisfying (1.1) and $\varphi(0) = 0$ are the monomials (1.2). The aim of this note is to prove an extension of Walorski's result by using a method which is (slightly) different from the two approaches presented in [1].

2. MAIN RESULTS.

Theorem. Let r_1, \dots, r_k be (fixed) positive real numbers with $\prod_{j=1}^k r_j > 1$. Then the only entire

solutions $\varphi: \mathbb{C} \rightarrow \mathbb{C}$ of

$$\prod_{j=1}^k |\varphi(r_j z)| \geq \left(\prod_{j=1}^k r_j \right) |\varphi(z)|^k \quad (2.1)$$

are the functions $\varphi(z) + cz^n$, where c is a complex number and n is a positive integer.

PROOF. Simple calculations reveal that the functions $\varphi(z) = cz^n$ ($c \in \mathbb{C}$, $n \in \mathbb{N}$) satisfy (2.1). Next we assume that φ is an entire solution of inequality (2.1).

Because of $\prod_{j=1}^k r_j > 1$ we conclude from (2.1) with $z = 0$ that φ has at 0 a zero. Let n be the order of this zero; we define

$$f(z) = \varphi(z)/z^n, \quad (2.2)$$

then f is an entire function with $f(0) \neq 0$. From (2.1) we obtain

$$\prod_{j=1}^k |f(r_j z)| \geq \left(\prod_{j=1}^k r_j^{1-n} \right) |f(z)|^k. \quad (2.3)$$

We suppose that f has a zero z_0 . By induction it follows from (2.3) that z_0/r_1^m is a root of f for all non-negative integers m . From the identity theorem we conclude $f(z) \equiv 0$ which contradicts the condition $f(0) \neq 0$. Hence f has no zero which implies that the function

$$g(z) = \frac{f(z)^k}{\prod_{j=1}^k f(r_j z)} \quad (2.4)$$

is entire. From (2.3) we conclude

$$|g(z)| \leq \prod_{j=1}^k r_j^{n-1} \quad \text{for all } z \in \mathbb{C},$$

and Liouville's theorem implies that g is a constant. Therefore we have

$$f(z)^k = K \prod_{j=1}^k f(r_j z), \quad K \in \mathbb{C}. \quad (2.5)$$

Since $f(0) \neq 0$ we get from (2.5): $K = 1$;

hence

$$f(z)^k = \prod_{j=1}^k f(r_j z). \quad (2.6)$$

Differentiation leads to

$$k \frac{f'(z)}{f(z)} = \sum_{j=1}^k r_j \frac{f'(r_j z)}{f(r_j z)}. \quad (2.7)$$

Setting

$$\frac{f'(z)}{f(z)} = \sum_{m=0}^{\infty} a_m z^m \quad (2.8)$$

we obtain from (2.7) and (2.8):

$$\sum_{m=0}^{\infty} k a_m z^m = \sum_{m=0}^{\infty} \left(a_m \sum_{j=1}^k r_j^{m+1} \right) z^m, \quad (2.9)$$

and comparing the coefficients of z^m yields for all $m \geq 0$:

$$ka_m = a_m \sum_{j=1}^k r_j^{m+1}. \quad (2.10)$$

We assume that there exists an integer $m_0 \geq 0$ such that $a_{m_0} \neq 0$, then we get from the arithmetic mean-geometric mean inequality and from (2.10):

$$\left[\sum_{j=1}^k r_j^{m_0+1} \right]^{1/k} \leq \frac{1}{k} \sum_{j=1}^k r_j^{m_0+1} = 1,$$

which contradicts the assumption $\sum_{j=1}^k r_j > 1$. Hence, $a_m = 0$ for all $m > 0$. This implies that f is a constant, say $c \in \mathbb{C}$, and therefore we obtain $\varphi(z) = cz^n$.

It is natural to look for all entire functions $\varphi: \mathbb{C} \rightarrow \mathbb{C}$ which satisfy the following additive counterpart of inequality (2.1):

$$\left(\sum_{j=1}^k \varphi(r_j z) \right) \geq \sum_{j=1}^k r_j |\varphi(z)|, \quad (2.11)$$

where r_1, \dots, r_k are (fixed) positive real numbers with $\sum_{j=1}^k r_j > k$. The monomials $\varphi(z) = cz^n$ ($c \in \mathbb{C}, n \in \mathbb{N}$) are solutions of (2.11). Indeed, inequality (2.11) with $\varphi(z) = cz^n$ reduces to

$$\sum_{j=1}^k r_j^n \geq \sum_{j=1}^k r_j, \quad (2.12)$$

which follows immediately from Jensen's inequality and the assumption $\sum_{j=1}^k r_j > k$. By an argumentation similar to the one we have used to establish the theorem it can be shown that the functions $\varphi(z)cz^n$ ($c \in \mathbb{C}, n \in \mathbb{N}$) are the only entire solutions of (2.11). This provides another extension of Walorski's result.

If the expression on the left-hand side of (2.11) will be replaced by $\sum_{j=1}^k |\varphi(r_j z)|$, then we conclude from the triangle inequality that $\varphi(z) = cz^n$ ($c \in \mathbb{C}, n \in \mathbb{N}$) also solve

$$\sum_{j=1}^k |\varphi(r_j z)| \geq \sum_{j=1}^k r_j |\varphi(z)|, \quad (2.13)$$

where r_1, \dots, r_k are (fixed) positive real numbers with $\sum_{j=1}^k r_j > k$. We finish by asking: Are there more solutions of (2.13) (if $k > 1$)?

Special Issue on Intelligent Computational Methods for Financial Engineering

Call for Papers

As a multidisciplinary field, financial engineering is becoming increasingly important in today's economic and financial world, especially in areas such as portfolio management, asset valuation and prediction, fraud detection, and credit risk management. For example, in a credit risk context, the recently approved Basel II guidelines advise financial institutions to build comprehensible credit risk models in order to optimize their capital allocation policy. Computational methods are being intensively studied and applied to improve the quality of the financial decisions that need to be made. Until now, computational methods and models are central to the analysis of economic and financial decisions.

However, more and more researchers have found that the financial environment is not ruled by mathematical distributions or statistical models. In such situations, some attempts have also been made to develop financial engineering models using intelligent computing approaches. For example, an artificial neural network (ANN) is a nonparametric estimation technique which does not make any distributional assumptions regarding the underlying asset. Instead, ANN approach develops a model using sets of unknown parameters and lets the optimization routine seek the best fitting parameters to obtain the desired results. The main aim of this special issue is not to merely illustrate the superior performance of a new intelligent computational method, but also to demonstrate how it can be used effectively in a financial engineering environment to improve and facilitate financial decision making. In this sense, the submissions should especially address how the results of estimated computational models (e.g., ANN, support vector machines, evolutionary algorithm, and fuzzy models) can be used to develop intelligent, easy-to-use, and/or comprehensible computational systems (e.g., decision support systems, agent-based system, and web-based systems)

This special issue will include (but not be limited to) the following topics:

- **Computational methods:** artificial intelligence, neural networks, evolutionary algorithms, fuzzy inference, hybrid learning, ensemble learning, cooperative learning, multiagent learning

- **Application fields:** asset valuation and prediction, asset allocation and portfolio selection, bankruptcy prediction, fraud detection, credit risk management
- **Implementation aspects:** decision support systems, expert systems, information systems, intelligent agents, web service, monitoring, deployment, implementation

Authors should follow the Journal of Applied Mathematics and Decision Sciences manuscript format described at the journal site <http://www.hindawi.com/journals/jamds/>. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at <http://mts.hindawi.com/>, according to the following timetable:

Manuscript Due	December 1, 2008
First Round of Reviews	March 1, 2009
Publication Date	June 1, 2009
