ABSTRACT. It is proved that the product method $A(C, 1)$, where $(C, 1)$ is the Cesàro arithmetic mean matrix, is totally effective under certain conditions concerning the matrix A . This general result is applied to study absolute Nörlund summability of Fourier series and other related series.

KEY WORDS AND PHRASES. Absolute summability, Nörlund summability.

AMS SUBJECT CLASSIFICATION NUMBER. 40F05

1. INTRODUCTION AND SOME RESULTS.

Let $A = (\alpha_{nk})$ be an infinite matrix with α_{nk} as real numbers. A given series $u = \sum_{k=0}^{\infty} u_k$ or the sequence of its partial sums $\{U_k\}$ is said to be $|A|$ summable if

$$v_n = \sum_{k=0}^{\infty} \alpha_{nk} u_k \quad (1.1)$$

is defined for all n , and $v = \sum_{n=0}^{\infty} v_n$ converges absolutely. v is the series-to-series, A -transformation of u and we denote it by Au . The matrix A is called absolutely conservative in case the absolute convergence of u implies that of Au . We will be mainly concerned with the case in which A is absolutely conservative and

$$\sum_{k=0}^{\infty} \frac{|\alpha_{nk}|}{k+1} < \infty \quad (1.2)$$

for every fixed $n \geq 0$. It may be worthwhile to mention that the condition:

$$\sum_{k=0}^{\infty} |\alpha_{nk}| < \infty \quad (1.2')$$

for every fixed $n \geq 0$, which is stronger than (1.2), is an essential requirement for the definition of Au for every u for which the sequence $\{u_n\}$ is convergent (see Szász [10], Lemmas 1 and 2 of Chapter III).

Let A, B be given matrices for which Bu and the A -transformation of Bu , viz., ABu are defined. Then the $|A|$ summability of Bu or equivalently the absolute convergence of ABu defines the $|AB|$ summability of u . It may be noted that the $|AB|$ summability is, in general, different

than the absolute summability defined by the product matrix $A.B$ (if it exists).

It may be observed that the condition (1.2') and *a fortiori* (1.2) are automatically satisfied whenever A is a lower triangular matrix (that is, $\alpha_{nk} = 0$ for $k > n$).

Let $p = \{p_n\}$ be a given sequence of real numbers such that $P_n = \sum_{k=0}^n p_k \neq 0$ and $P_{-1} = 0$. (N, p) matrix is the lower triangular matrix A with

$$\begin{aligned} \alpha_{00} &= 1, \quad \alpha_{n0} = 0, \quad n \geq 1, \quad \alpha_{nk} = \frac{P_{n-k}}{P_n} - \frac{P_{n-k-1}}{P_{n-1}} \\ &= \frac{P_n p_{n-k} - P_{n-k} p_n}{P_n P_{n-1}}, \quad 1 \leq k \leq n, \end{aligned} \quad (1.3)$$

and then (1.1) defines the series-to-series (N, p) -transformation. The (N, p) -transformation with $p_n = 1$ for $n = 0, 1, 2, \dots$, defines the series-to-series $(C, 1)$ -transformation, given by $b_n = a_n$ and

$$b_n = \frac{1}{n(n+1)} \sum_{k=1}^n k a_k = S_n^1 - S_{n-1}^1, \quad n \geq 1, \quad (1.4)$$

where $S_n^1 = \sum_{k=0}^n s_k / (n+1)$ and $\{s_n\}$ is the sequence of partial sums.

For any sequence $\{\beta_n\}$, we write $\Delta\beta_n = \beta_n - \beta_{n+1}$. $\{\beta_n\} \in BV$ means that $\sum_{n=1}^{\infty} |\Delta\beta_n| < \infty$.

Let $f(t)$ be an (L) -integrable periodic function with period 2π . We assume, without loss of generality that the constant term of the Fourier series $F(t)$ of $f(t)$ is zero. Let $F(t) = \sum_{n=1}^{\infty} A_n(t)$ and $\bar{F}(t)$ denotes its conjugate series: $\sum_{n=1}^{\infty} B_n(t)$. Also, $F^*(t) = \{n B_n(t)\}$, and $F'(t)$ is the derived series of $F(t)$. For a given point x , we write

$$\phi(t) = \phi_o(t) = \frac{1}{2} \{f(x+t) + f(x-t)\}, \quad \psi(t) = \frac{1}{2} \{f(x+t) - f(x-t)\},$$

$$t\phi_1(t) = \Phi_1(t) = \int_0^t \phi(u) du,$$

and taking $r = 0$ or 1 , we say that A is $|F_r|$ -effective provided that $\phi_r(t) \in BV(0, \pi)$ implies that $F(x)$ is $|A|$ summable. We say that A is (i) $|\bar{F}_1|$ -effective if $\int_0^\pi |\psi(t)| t^{-1} dt < \infty$ implies that $F(x)$ is $|A|$ summable. (ii) $|F_1^*|$ -effective if $\psi(t) \in BV(0, \pi)$ implies that $F^*(x)$ is $|A|$ summable. (iii) $|F_1'|$ -effective if $\{t^{-1}\psi(t)\} \in BV(0, \pi)$ implies that $F'(x)$ is $|A|$ summable and absolutely total effective if it is effective in each of the senses defined above.

Unless stated otherwise, $\theta = [\pi/t]$, i.e., the greatest integer not greater than π/t , and K denotes a positive constant not necessarily the same at each occurrence.

For a general matrix A , Tripathy [11] (see also Kuttner and Tripathy [8]) and, Kuttner and Sahney [7] have obtained sufficient conditions so that A is $|F_0|$ -effective. The restrictions imposed on A in [11] are quite general, but it is usually difficult to verify them for special cases of interest. The nature of the corresponding conditions used in [7] is such that they can be easily verified, and, therefore the following result due to Kuttner and Sahney has the advantage of having some direct applications.

THEOREM A. *Let the matrix A be absolutely conservative and $\alpha_{nk} \geq 0$ for all n, k . Suppose that either*

- (a) *for each fixed n , there is a positive integer $r(n)$ such that $\{\alpha_{nk}\}$ is nondecreasing for $1 \leq k \leq r(n)$ and nonincreasing for $k \geq r(n)$, or*

(b) for each fixed n , there is a positive integer $s(n)$ such that $\{\alpha_{nk}/k\}$ is nondecreasing for $1 \leq k \leq s(n)$ and nonincreasing for $k \geq s(n)$.

Suppose also that in case (a), for $k_0 \geq 1$

$$\sum_{r(n) \geq 2k_0} \frac{1}{r(n)} \sum_{k=r(n)-k_0}^{r(n)+k_0} \alpha_{nk} = O(1) \quad (1.5)$$

and in case (b), for $k_0 \geq 1$

$$\sum_{s(n) \geq 2k_0} \frac{1}{s(n)} \sum_{k=s(n)-k_0}^{s(n)+k_0} \alpha_{nk} = O(1). \quad (1.6)$$

Then A is $|F_o|$ -effective.

Starting with an absolutely conservative method A , we obtain in the present paper a sufficient condition that connects the proof of absolutely total effectiveness of $A(C, 1)$ with the proof of $|F_o|$ -effectiveness of the A matrix. As we shall see, such a result has some interesting applications. We will first prove the following.

THEOREM 1. If A is absolutely conservative, (1.2) holds and

$$\sum_{n=1}^{\infty} \left| \sum_{k=2\theta}^{\infty} \alpha_{nk} \frac{\exp(ikt)}{k} \right| = O(1) \quad (1.7)$$

for $t \in (0, \pi]$, then $A(C, 1)$ is absolutely total effective.

We shall obtain the following corollaries to Theorem 1.

COROLLARY 1. If A satisfies the hypotheses of Theorem 1 and (1.2), then $A(C, 1)$ is absolutely total effective.

COROLLARY 2. If $\{p_n\}$ is any sequence such that $\{(n+1)p_n/P_n\} = \{R_n\} \in BV$ and

$$\left\{ \frac{1}{P_n} \sum_{k=0}^n (k+1)^{-1} |P_k| \right\} = \{S_n^*\} \in B,$$

i.e., $\{S_n^*\}$ is a bounded sequence, then $(N, p)(C, 1)$ is absolutely total effective.

As we shall see in the last section of the present paper, a special case of Corollary 1 provides a result which includes, *inter alia*, sharper results than those proved elsewhere. (Cf. [3], Theorems 1 and 2). On the other hand, Corollary 2 includes *inter alia* the results contained in [4] (Theorems 1 and 2).

In Section 4, we obtain another theorem which provides a somewhat more direct sufficient condition for $|F_1|$ - and $|F'_1|$ -effectiveness of $A(C, 1)$. This theorem, which is less general than Theorem 1 in the sense that it does not provide the absolutely total effectiveness of $A(C, 1)$, is readily applicable, and we deduce from it considerably shorter proofs of some earlier results (see [1], Theorems 1 and 2).

2. SOME PRELIMINARY RESULTS.

We shall need the following lemmas for the proof of Theorem 1 and its corollaries.

LEMMA 1. The necessary and sufficient condition that A be absolutely conservative is that for all $k \geq 0$,

$$\sum_{n=0}^{\infty} |\alpha_{nk}| = O(1). \quad (2.1)$$

The result of Lemma 1 is well known. See, e.g., [9] or [6].

LEMMA 2. Let $\{a_n\}$ be a given sequence; then for any number x we have

$$-(1-x) \sum_{k=m}^n a_k x^k = \sum_{k=m}^n \Delta a_k x^{k+1} - a_m x^m + a_{n+1} x^{n+1},$$

where m and n are integers such that $n \geq m \geq 0$.

The proof of Lemma 2 is a straight forward calculation.

LEMMA 3. If A satisfies the hypotheses of Theorem A, then (1.7) holds.

PROOF. Observing that $(\sin kt)/k$ is the imaginary part of $\exp(ikt)/k$, we shall prove (1.7) by following closely the proof of Theorem A, which contains the proof for $\sum_n |b_n(t)| = O(1)$ with $\sum_n b_n(t)$ as the A -transformation of $\sum_{k=1}^{\infty} (\sin kt)/k$. Thus, considering those values of n (if any) for which $r(n) \leq 2\theta$ (or $s(n) \leq 2\theta$), we have that $\{\alpha_{nk}/k\}$ is nonnegative and nonincreasing for $k \geq 2\theta$. Therefore, by an application of Abel's Lemma to the inner sum and using the fact that the partial sums $\sum \exp(ikt)$ are $O(1/t)$, we have

$$\sum_{\substack{r(n) \leq 2\theta \\ \text{or } s(n) \leq 2\theta}} \left| \sum_{k=2\theta}^{\infty} \alpha_{nk} \frac{\exp(ikt)}{k} \right| = O\left\{ \sum_{n=1}^{\infty} \alpha_{n,2\theta} \right\} = O(1);$$

the $O(1)$ estimate is obtained from Lemma 1 and the hypothesis that A is absolutely conservative. Considering the case (b), we follow exactly the argument in [7], p. 413, to get

$$\sum_{s(n) \geq 2\theta} \left| \sum_{k=2\theta}^{\infty} \alpha_{nk} \frac{\exp(ikt)}{k} \right| = O(1).$$

In case (a), the part of the sum for $k \geq r(n) - \theta$ may be dealt with as in [7], p. 413, and it remains to show that when $r(n) - \theta > 2\theta$, then

$$\sum_{r(n) > 3\theta} \left| \sum_{k=2\theta}^{r(n)-\theta} \alpha_{nk} \frac{\exp(ikt)}{k} \right| = O(1). \quad (2.2)$$

To verify this we apply Lemma 2 and get (cf. [7], p. 413)

$$\left| \sum_{k=2\theta}^{r(n)-\theta} \frac{\alpha_{nk}}{k} \exp(ikt) \right| \leq K t^{-1} \left[\sum_{k=2\theta}^{r(n)-\theta} |\Delta_k(\alpha_{nk}/k)| + \frac{\alpha_{n,2\theta}}{\theta} + \frac{\alpha(n, r(n) - \theta + 1)}{r(n) - \theta + 1} \right],$$

where, for convenience, we write $\alpha(n, k)$ for α_{nk} . The rest of the proof of (2.2) follows directly from [7]. This completes the proof of the present lemma.

LEMMA 4. If $\{p_n\}$ satisfies the hypotheses of Corollary 2, then (N, p) is absolutely regular and *a fortiori* absolutely conservative.

Lemma 4 may be proved by following the proof of Lemma 10 in [4].

LEMMA 5. If $\{R_n\} \in B$, then $\{S_n^*\} \in B$ implies that $P_n^* = \sum_{k=0}^n |p_k| = O(|P_n|)$ and $\{S_n^*\} \in B$ is equivalent to the following:

$$|P_n| \sum_{k=n}^{\infty} \frac{1}{k|P_k|} = O(1), \quad n = 1, 2, \dots$$

The first part of the lemma follows directly when we observe that

$$\sum_{k=0}^n |p_k| = \sum_{k=0}^n \frac{|R_k P_k|}{k+1}$$

and appeal to the hypotheses $\{R_n\} \in B$ and $\{S_n^*\} \in B$. The second part follows as a special case of

an earlier result (see [5], Lemma 3; see also [2]).

LEMMA 6. If $P_n^* = O(|P_n|)$, then uniformly for all $r, s (r \geq s \geq 0)$

$$\left| \sum_{k=s}^r P_k \exp(-ikt) \right| \leq Kt^{-1} |P_r|$$

uniformly in $0 < t \leq \pi$.

Lemma 6 may be proved by applying Abel's transformation and using the result that the partial sums $\sum \exp(-ikt)$ are $O(1/t)$.

LEMMA 7. If $\{p_n\}$ satisfies the hypotheses of Corollary 2, then (1.7) holds for the (N, p) -transformation defined by (1.3).

PROOF. Consider the condition:

$$N = \sum_{n=\theta}^{\infty} \left| \sum_{k=\theta}^n \left[\frac{P_{n-k}}{P_n} - \frac{P_{n-k-1}}{P_{n-1}} \right] \frac{\exp(ikt)}{k} \right| = O(1), \quad (2.3)$$

which is obtained from (1.7) by replacing 2θ by θ .

We shall first prove (2.3). Now observing that

$$\frac{P_k}{P_n} - \frac{P_{k-1}}{P_{n-1}} = \frac{1}{(n+1)P_{n-1}} [P_k(R_k - R_n) + (n-k)p_k],$$

we have

$$\begin{aligned} N &\leq \sum_{n=\theta}^{\infty} \frac{1}{n|P_{n-1}|} \left| \sum_{k=0}^{n-\theta} P_k \frac{\exp(-ikt)}{n-k} \sum_{r=k}^{n-1} (\Delta R_r) \right| \\ &\quad + \sum_{n=\theta}^{\infty} \frac{1}{n|P_{n-1}|} \left| \sum_{k=0}^{n-\theta} p_k \exp(-ikt) \right| \\ &= N_1 + N_2, \end{aligned} \quad (2.4)$$

say. Applying Abel's Lemma to the inner sum, we have

$$N_1 \leq Kt \sum_{n=\theta}^{\infty} \frac{1}{n|P_{n-1}|} \max_{0 \leq m \leq n-\theta} \left| \sum_{k=m}^{n-\theta} P_k \exp(-ikt) \sum_{r=k}^{n-1} \Delta R_r \right|.$$

Writing r' for $\min(r, n-\theta)$, we see that by a change in the order of summation, we have for any

$0 \leq m < n$

$$\begin{aligned} \left| \sum_{k=m}^{n-\theta} P_k \exp(-ikt) \sum_{r=k}^{n-1} \Delta R_r \right| &= \left| \sum_{r=m}^{n-1} \Delta R_r \sum_{k=m}^{r'} P_k \exp(-ikt) \right| \\ &\leq K_1 t^{-1} \sum_{r=0}^{n-1} |\Delta R_r| |P_r|, \end{aligned}$$

by virtue of Lemma 6. Thus,

$$\begin{aligned} N_1 &\leq K_1 \sum_{n=1}^{\infty} \frac{1}{n|P_{n-1}|} \sum_{r=0}^{n-1} |\Delta R_r| |P_r| \\ &= K_1 \sum_{r=0}^{\infty} |\Delta R_r| |P_r| \sum_{n=r}^{\infty} \frac{1}{(n+1)|P_n|} = O(1), \end{aligned} \quad (2.5)$$

by virtue of Lemma 5 and the hypothesis that $\{R_n\} \in BV$.

Taking $\sum_a^b = 0$ if $a > b$, breaking the range for k into two parts viz., $k < \theta$ and $k \geq \theta$ and observing that by Lemma 5, $P_n^* = O(|P_n|)$, we have

$$N_2 \leq K_1 |P_{\theta}| \sum_{n=\theta}^{\infty} \frac{1}{n|P_{n-1}|} + K_1 \sum_{n=\theta}^{\infty} \frac{1}{n|P_{n-1}|} \left| \sum_{k=\theta}^{n-\theta} p_k \exp(-ikt) \right|.$$

Since $p_k = P_k \{R_k / (k+1)\}$ and the partial sums of $\sum \exp(-ikt) = O(1/t)$, an application of the

Abel's transformation shows that for any m with $\theta \leq m \leq n$, we have

$$\begin{aligned} |\sum_{k=m}^n p_k \exp(-ikt)| &\leq K t^{-1} \sum_{k=m}^{n-1} |\Delta \left(\frac{R_k P_k}{k+1} \right)| + K t^{-1} \frac{|P_n|}{n} \\ &\leq K \sum_{k=\theta}^n \{ |\Delta R_k| + \frac{t^{-1}}{k(k+1)} \} |P_k| + K t^{-1} \frac{|P_n|}{n}. \end{aligned}$$

Thus, using the result of Lemma 5 and a suitable change in the order of summations, we have

$$N_2 \leq K + K \sum_{k=\theta}^{\infty} \{ |\Delta R_k| + \frac{t^{-1}}{k(k+1)} \} |P_k| \sum_{n=k}^{\infty} \frac{1}{n|P_{n-1}|} = O(1), \quad (2.6)$$

because $\{R_n\} \in BV$.

Combining (2.5) with (2.6), we prove (2.3). Since the above proof remains valid if θ is replaced by 2θ , we deduce (1.7) from the proof of (2.3).

3. PROOF OF THEOREM 1 AND ITS COROLLARIES.

(1). $|L_1|$ -effectiveness: We have assumed without loss of generality that the constant term in $F(x)$ is zero so that

$$\Phi_1(\pi) = \int_0^\pi \phi(t) dt = 0. \quad (3.1)$$

Now, we have

$$A_n(x) = \frac{2}{\pi} \int_0^\pi \phi(t) \cos nt \, dt.$$

Denoting by $\sum A_k^1(x)$ the series-to-series $(C, 1)$ -transformation of $F(x)$, we have

$$A_k^1(x) = \frac{2}{\pi} \int_0^\pi \phi(t) \frac{1}{k(k+1)} \sum_{r=1}^k r \cos rt \, dt.$$

Integrating by parts we see that $A_k^1(x)$ is the real part of

$$\begin{aligned} \frac{2}{\pi} \int_0^\pi \phi(t) \delta_k(t) dt &= \frac{2}{\pi} \int_0^\pi t \phi_1(t) \phi \frac{d}{dt} \delta_k(t) dt \\ &= \frac{2}{\pi} \int_0^\pi \{ t \delta_k(t) - \int_0^t \delta_k(u) du \} d\phi_1(t) \end{aligned} \quad (3.2)$$

where

$$\delta_k(t) = \frac{1}{k(k+1)} \sum_{r=1}^k r \exp(irt).$$

Thus, if $\sum b_n(x)$ denotes the $A(C, 1)$ -transformation of $F(x)$, then we have

$$\begin{aligned} b_n(x) &= -\frac{2}{\pi} \sum_{k=1}^{\infty} \alpha_{nk} \int_0^\pi t [Re \delta_k(t)] d\phi_1(t) \\ &\quad + \frac{2}{\pi} \sum_{k=1}^{\infty} \alpha_{nk} \int_0^\pi \left(\int_0^t [Re \delta_k(u)] du \right) d\phi_1(t). \end{aligned} \quad (3.3)$$

Now it is easily seen that $\delta_k(t) = O(1/kt)$, therefore,

$$t \sum_{k=1}^{\infty} |\alpha_{nk}| |\delta_k(t)| = O(1), \quad (3.4)$$

by virtue of the condition (1.2). Next we notice that

$$\int_0^t [Re \delta_k(u)] du = \frac{1}{k(k+1)} \sum_{r=1}^k \sin rt.$$

Thus,

$$\sum_{k=1}^{\infty} |\alpha_{nk}| \left| \int_0^t [Re \delta_k(u)] du \right| = O(1), \quad (3.5)$$

by virtue of the condition (1.2). In view of (3.4) and (3.5), we have

$$b_n(x) = -\frac{2}{\pi} \int_0^\pi [tR(n, t) - \sum_{k=1}^{\infty} \alpha_{nk} \int_0^t \operatorname{Re} \delta_k(u) du] d\phi_1(t) \quad (3.6)$$

where $R(n, t)$ is the real part of

$$J(n, t) = \sum_{k=1}^{\infty} \alpha_{nk} \delta_k(t).$$

Since by hypothesis $\int_0^\pi |d\phi_1(t)| \leq K$, in order to prove that $A(C, 1)$ is $|F_1|$ -effective, it is sufficient to show that the following estimates hold for $t \in (0, \pi]$:

$$S_1 = t \sum_{n=1}^{\infty} |J(n, t)| = O(1) \quad (3.7)$$

$$S_2 = \sum_{n=1}^{\infty} \left| \sum_{k=1}^{\infty} \alpha_{nk} \int_0^t \operatorname{Re} \delta_k(u) du \right| = O(1). \quad (3.8)$$

We first proceed to prove (3.7). Breaking the range of summation for the inner sum into $1 \leq k < 2\theta$ and $2\theta \leq k$, we use for the former range the fact that $\delta_k(t) = O(1)$, while for the latter range we replace $\delta_k(t)$ by the following expression which is equal to it:

$$\frac{(1 - \exp(it))^{-1}}{k+1} \left\{ \frac{1}{k} \sum_{r=1}^k \exp(irt) - \exp(i[k+1]t) \right\}.$$

Thus, we write

$$\begin{aligned} S_1 &\leq Kt \sum_{n=1}^{\infty} \sum_{k=1}^{2\theta-1} |\alpha_{nk}| + K \sum_{n=1}^{\infty} \left| \sum_{k=2\theta}^{\infty} \frac{\alpha_{nk}}{k} \left(1 - \frac{1}{k+1}\right) \exp(i[k+1]t) \right| \\ &\quad + K \sum_{n=1}^{\infty} \left| \sum_{k=2\theta}^{\infty} \alpha_{nk} \frac{1}{k(k+1)} \sum_{r=1}^k \exp(irt) \right| \\ &\leq Kt \sum_{k=1}^{2\theta} \sum_{n=1}^{\infty} |\alpha_{nk}| + K \sum_{n=1}^{\infty} \left| \sum_{k=2\theta}^{\infty} \alpha_{nk} \frac{\exp(ikt)}{k} \right| \\ &\quad + K\theta \sum_{n=1}^{\infty} \sum_{k=2\theta}^{\infty} \frac{1}{k(k+1)} |\alpha_{nk}| \\ &\leq Kt \sum_{k=1}^{2\theta} 1 + K\theta \sum_{k=2\theta}^{\infty} \frac{1}{k(k+1)} \sum_{n=1}^{\infty} |\alpha_{nk}| + O(1) \\ &= O(1), \end{aligned}$$

by virtue of the hypothesis (1.7) and that A is absolutely conservative so that (2.1) holds. We thus prove (3.7). Next, we have

$$\begin{aligned} S_2 &\leq \sum_{n=1}^{\infty} \left(\sum_{k=1}^{\theta-1} + \sum_{k=\theta}^{\infty} \right) \alpha_{nk} \frac{1}{k(k+1)} \sum_{r=1}^k \sin rt \\ &\leq t \sum_{k=1}^{\theta-1} \sum_{n=1}^{\infty} |\alpha_{nk}| + Kt^{-1} \sum_{n=1}^{\infty} \sum_{k=\theta}^{\infty} \frac{1}{k(k+1)} |\alpha_{nk}| \\ &= O(1), \end{aligned}$$

by reasoning parallel to that used in the preceding paragraph. Thus (3.8), holds and we complete the proof of $|F_1|$ -effectiveness of $A(C, 1)$.

(II). $|\bar{F}_1|$ -effectiveness: Since, for the series $\bar{F}(x)$,

$$B_n(x) = \frac{2}{\pi} \int_0^\pi \psi(t) \sin nt \, dt,$$

it follows from (3.4) that

$$\bar{b}_n(x) = \frac{2}{\pi} \int_0^\pi \psi(t) I(n, t) dt,$$

where $I(n, t)$ is the imaginary part of $J(n, t)$ and $\sum_n \bar{b}_n(x)$ is the $A(C, 1)$ -transformation of $\bar{F}(x)$. But by hypothesis $\int_0^\pi t^{-1} |\psi(t)| dt \leq K$; therefore, in order to prove the $|\bar{F}_1|$ -effectiveness of $A(C, 1)$ it is sufficient to show that

$$t \sum_{n=1}^{\infty} |I(n, t)| = O(1).$$

This follows directly from (3.7), and we complete the proof of the $|\bar{F}_1|$ -effectiveness of $A(C, 1)$.

(III). $|F_1^*|$ -effectiveness: For the sequence $F^*(x)$,

$$nB_n(x) = \frac{2}{\pi} \int_0^\pi \cos nt \, d\psi(t),$$

since $\psi(\pi) = 0$. Thus, the terms of the corresponding series are obtained as

$$u_n(x) = \frac{4}{\pi} \int_0^\pi \sin\left(\frac{1}{2}t\right) \sin\left(n - \frac{1}{2}\right)t \, d\psi(t).$$

Denoting by $\sum u_n^1(x)$ the series-to-series $(C, 1)$ -transformation of $\sum u_n(x)$, we have

$$u_n^1(x) = \frac{1}{\pi} \int_0^\pi \sin\left(\frac{t}{2}\right) \left\{ \cos\left(\frac{t}{2}\right) \operatorname{Im} \delta_k(t) - \sin\left(\frac{t}{2}\right) \operatorname{Re} \delta_k(t) \right\} d\psi(t).$$

Thus, if $\sum b_n^*(x)$ denotes the $A(C, 1)$ -transformation of $F^*(x)$ then in view of (3.4), we have

$$b_n^*(x) = \frac{4}{\pi} \int_0^\pi \sin\left(\frac{1}{2}t\right) \left\{ \cos\left(\frac{1}{2}t\right) I(n, t) - \sin\left(\frac{1}{2}t\right) R(n, t) \right\} d\psi(t).$$

But by hypothesis $\psi(t) \in BV(0, \pi)$; therefore, in order to prove the $|F_1^*|$ -effectiveness of $A(C, 1)$ it is sufficient to show that (3.7) holds. We thus complete the proof of the $|F_1^*|$ -effectiveness of $A(C, 1)$.

(IV). $|F_1'|$ -effectiveness: For the series $F'(x) = \sum u_n(x)$, we have

$$u_n(x) = -\frac{2}{\pi} \int_0^\pi \psi(t) \frac{d}{dt} (\cos nt) dt,$$

and, therefore,

$$u_n^1(x) = -\frac{2}{\pi} \int_0^\pi \frac{\psi(t)}{t} \operatorname{Re} \left\{ \frac{d}{dt} \delta_k(t) \right\} dt. \quad (3.9)$$

Following the proof of the $|F_1|$ -effectiveness part, we deduce $|F_1'|$ -effectiveness of $A(C, 1)$ from (3.7) and (3.8) by comparing (3.9) with (3.2) and then appealing to the hypothesis that $(\psi(t)/t) \in BV(0, \pi)$.

Since $\phi(t) \in BV(0, \pi)$ implies that $\phi_1(t) \in BV(0, \pi)$, the $|F_0|$ -effectiveness of $A(C, 1)$ is included in its $|F_1|$ -effectiveness. Thus combining (I) - (IV), we complete the proof of Theorem 1.

To prove Corollary 1 we note that if A satisfies the hypotheses of Theorem A, then Lemma 3 ensures the condition (1.7) of Theorem 1. This together with (1.2) implies the conclusion of Theorem 1, which is also the conclusion of Corollary 1. Since for the (N, p) transformation, (1.2) holds automatically we use Lemma 4 and Lemma 7 to see that the hypotheses of Theorem 1 are satisfied and in conclusion we obtain Corollary 2.

4. ADDITIONAL RESULTS.

We shall also prove the following.

THEOREM 2. If A is absolutely conservative and the condition $g(t) \in BV(0, \pi)$ implies the $|A|$ summability of $\sum w_n$, where

$$w_n = \int_0^\pi g(t) \cos(n + \frac{1}{2})t \, dt, \quad (4.1)$$

then the $A(C, 1)$ is $|F_1|$ - and $|F'_1|$ -effective.

Comparing the hypotheses of Theorem 1 with those of Theorem 2, we observe that the condition (1.7) of Theorem 1 is directly associated with the $|A|$ summability of the series $\sum_{k=1}^\infty \exp(ikt)/k$. Similarly, the corresponding condition of Theorem 2 is closely associated with $|F_0|$ -effectiveness of A , which is usually proved by establishing the stronger result that $\sum |c_n(t)| = O(1)$ where $\sum c_n(t)$ is the A -transformation of $\sum (\sin kt)/k$.

We shall need the following additional lemmas for the proof of Theorem 2.

LEMMA 8. For any fixed $\lambda \geq 0$, we set

$$u(t) = \sum_{k=1}^\infty \{\sin(k + \lambda)t\}/(k + \lambda).$$

If $\sum_n c_n(t)$ is either (i) the A -transformation of $u(t)$ such that A satisfies the hypotheses of Theorem A, or (ii) the (N, p) -transformation of $u(t)$ such that $\{p_n\}$ satisfies the hypotheses of Corollary 2, then $\sum_n |c_n(t)| = O(1)$ for $t \in [0, \pi]$.

PROOF. In view of Lemma 4 and the hypotheses of Theorem A we notice that both A and (N, p) are absolutely conservative and it follows that in order to prove Lemma 8 it is enough to prove it with $u(t)$ replaced by $v(t) = \sum_k \{\sin(k + \lambda)t\}/k$. But we may prove this by following closely the proof of Lemma 8 for the case $\lambda = 0$ which is contained in [7], [2] (proof of Theorem C). This completes the proof of the lemma.

LEMMA 9. If $g(t) \in BV(0, \pi)$, then $\{V_n\} \in BV$, where

$$\pi V_n = \frac{1}{n+1} \int_0^\pi g(t) \left[\frac{\sin \frac{1}{2}(n+1)t}{\sin \frac{1}{2}t} \right]^2 dt. \quad (4.2)$$

PROOF. Let $\sum A_n(x)$ denote the Fourier series at $t = x$, of a 2π -periodic function $f(t)$ such that $g(t) = \frac{1}{2}\{f(x+t) + f(x-t)\}$. Then we see that $V_n = \sum_{k=0}^n s_k(x)/(n+1)$, where $\{s_k(x)\}$ is the sequence of partial sums of $\sum A_k(x)$. Thus, in view of (1.4) the result of the lemma is essentially that $(C, 1)$ is $|F_0|$ -effective. The lemma now follows from Bosanquet [1] where it has been shown that (C, α) is $|F_0|$ -effective for $\alpha > 0$.

5. PROOF OF THEOREM 2.

(I). $|F_1|$ -effectiveness: Taking $\sum a_n = F(x)$ in (1.4) we have

$$\begin{aligned} \pi S_n^1 &= \frac{1}{(n+1)} \int_0^\pi \phi(t) \sum_{r=0}^n \left\{ \sin(r + \frac{1}{2})t / \sin \frac{1}{2}t \right\} dt \\ &= \frac{1}{(n+1)} \int_0^\pi \phi(t) \left\{ \sin \frac{1}{2}(n+1)t / \sin \frac{1}{2}t \right\}^2 dt. \end{aligned}$$

Using (3.1) and integration by parts (cf. [4], p. 480), we have

$$\begin{aligned} S_n^1 &= -\frac{1}{2\pi} \int_0^\pi \frac{\Phi_1(t)}{\sin \frac{1}{2}t} \left\{ \frac{\sin(n+1)t}{\sin \frac{1}{2}t} \right\} dt \\ &\quad + \frac{1}{\pi(n+1)} \int_0^\pi \frac{\Phi_1(t)}{\sin \frac{1}{2}t} \left\{ \cos \frac{1}{2}t \right\} \left\{ \frac{\sin \frac{1}{2}(n+1)t}{\sin \frac{1}{2}t} \right\}^2 dt \end{aligned} \quad (5.1)$$

$$= W_n + V_n,$$

say. Thus, in order to prove that $A(C, 1)$ is $|F_1|$ -effective it is enough to show that both $\sum(V_n - V_{n-1})$ and $\sum(W_n - W_{n-1})$ are $|A|$ summable. That the former of these is $|A|$ summable follows from Lemma 9 and the hypothesis that A is absolutely conservative when we observe that $\phi_1(t) \in BV(0, \pi)$. Next we see that

$$W_n - W_{n-1} = -\frac{1}{\pi} \int_0^\pi \frac{\Phi_1(t)}{\sin \frac{1}{2}t} \cos(n + \frac{1}{2})t \, dt$$

and, therefore, $|A|$ summability of $\sum(W_n - W_{n-1})$ follows from the hypotheses of Theorem 2 when we appeal to the fact that $(\Phi_1(t)/\sin \frac{1}{2}t) \in BV(0, \pi)$. This completes the proof of the $|F_1|$ -effectiveness of $A(C, 1)$.

(II). $|F'_1|$ -effectiveness: Taking $\sum a_n = F'(x)$ in (1.4), we have (cf. [4], p. 480)

$$\begin{aligned} S_n^1 &= -\frac{1}{\pi(n+1)} \int_0^\pi \psi(t) \frac{d}{dt} \left\{ \frac{\sin \frac{1}{2}(n+1)t}{\sin \frac{1}{2}t} \right\}^2 dt \\ &= -\frac{1}{2\pi} \int_0^\pi \frac{\psi(t)}{\sin \frac{1}{2}t} \left\{ \frac{\sin(n+1)t}{\sin \frac{1}{2}t} \right\} dt \\ &\quad + \frac{1}{\pi(n+1)} \int_0^\pi \frac{\psi(t)}{\sin \frac{1}{2}t} (\cos \frac{1}{2}t) \left\{ \frac{\sin \frac{1}{2}(n+1)t}{\sin \frac{1}{2}t} \right\}^2 dt. \end{aligned} \quad (5.2)$$

Comparing (5.2) with (5.1) and observing that by hypothesis $\{\psi(t)/\sin \frac{1}{2}t\} \in BV(0, \pi)$, we prove that $A(C, 1)$ is $|F'_1|$ -effective by following the preceding proof. This completes the proof of Theorem 2.

6. REMARKS.

We observe that the hypothesis concerning the $|A|$ summability of $\sum_{n=1}^\infty w_n$ was applied in the proof of Theorem 2 for $g(t) = \Phi_1(t)/\sin \frac{1}{2}t$ and $\psi(t)/\sin \frac{1}{2}t$. Thus, in view of (3.1) and $\psi(\pi) = 0$ we may take $g(\pi) = 0$. Therefore, on integration by parts we see from (4.1) that

$$w_n = - \int_0^\pi \left\{ \sin(n + \frac{1}{2})t \right\} / (n + \frac{1}{2}) dg(t).$$

If we now denote by $\sum y_n$ the A -transform of $\sum w_n$ and assume (1.2) and that $g(t) \in BV(0, \pi)$, then

$$\begin{aligned} y_n &= - \sum_{k=1}^\infty \alpha_{nk} \int_0^\pi \left\{ \sin(k + \frac{1}{2})t \right\} / (k + \frac{1}{2}) dg(t) \\ &= - \int_0^\pi c_n(t) dg(t) \end{aligned}$$

and a sufficient condition for the $|A|$ summability of $\sum_{n=1}^\infty w_n$ is that $\sum |c_n(t)| = O(1)$ where $\sum c_n(t)$ is the A -transformation of $\sum_{k=1}^\infty \sin(k + \frac{1}{2})t / (k + \frac{1}{2})$. This is satisfied, however, by virtue of Lemma 8, when either A satisfies the hypotheses of Corollary 1 or A is (N, p) and satisfies the hypotheses of Corollary 2. Thus we deduce from Theorem 2, $|F_1|$ - and $|F'_1|$ -effective parts of Corollary 1 and Corollary 2. It is interesting to observe that the foregoing arguments provide remarkably shorter proofs of some earlier results ([4], Theorems 1 and 2).

Following [7], we observe that if $\{p_n\}$ is nonnegative, nonincreasing and $\{S_n^*\} \in B$, then the (N, p) satisfies the hypotheses of Theorem A, and Corollary 1 provides the following result which *inter alia* includes sharper results than those proved elsewhere ([3], Theorems 1 and 2).

COROLLARY 3. If $\{p_n\}$ is nonnegative, nonincreasing, and $\{S_n^*\} \in B$, then the $(N, p)(C, 1)$ is absolutely total effective.

Corollary 1 also shows that if, in Corollary 2, we impose the additional restriction that $\{p_n\}$ is nonnegative and nonincreasing, then the hypothesis $\{R_n\} \in BV$ may be deleted. It may be mentioned here, however, that there exist sequences $\{p_n\}$ which satisfy the hypotheses of Corollary 2 but which are not even monotonic. The absolutely total effectiveness of the Cesàro matrix (C, δ) for $\delta > 1$ was initiated by Bosanquet [1] and was completed subsequently. As a special case of Corollaries 1 and 2, we obtain the absolutely total effectiveness of the (C, δ) matrix for $\delta > 1$.

The authors should like to thank the referee for some helpful suggestions.

Special Issue on Intelligent Computational Methods for Financial Engineering

Call for Papers

As a multidisciplinary field, financial engineering is becoming increasingly important in today's economic and financial world, especially in areas such as portfolio management, asset valuation and prediction, fraud detection, and credit risk management. For example, in a credit risk context, the recently approved Basel II guidelines advise financial institutions to build comprehensible credit risk models in order to optimize their capital allocation policy. Computational methods are being intensively studied and applied to improve the quality of the financial decisions that need to be made. Until now, computational methods and models are central to the analysis of economic and financial decisions.

However, more and more researchers have found that the financial environment is not ruled by mathematical distributions or statistical models. In such situations, some attempts have also been made to develop financial engineering models using intelligent computing approaches. For example, an artificial neural network (ANN) is a nonparametric estimation technique which does not make any distributional assumptions regarding the underlying asset. Instead, ANN approach develops a model using sets of unknown parameters and lets the optimization routine seek the best fitting parameters to obtain the desired results. The main aim of this special issue is not to merely illustrate the superior performance of a new intelligent computational method, but also to demonstrate how it can be used effectively in a financial engineering environment to improve and facilitate financial decision making. In this sense, the submissions should especially address how the results of estimated computational models (e.g., ANN, support vector machines, evolutionary algorithm, and fuzzy models) can be used to develop intelligent, easy-to-use, and/or comprehensible computational systems (e.g., decision support systems, agent-based system, and web-based systems)

This special issue will include (but not be limited to) the following topics:

- **Computational methods:** artificial intelligence, neural networks, evolutionary algorithms, fuzzy inference, hybrid learning, ensemble learning, cooperative learning, multiagent learning

- **Application fields:** asset valuation and prediction, asset allocation and portfolio selection, bankruptcy prediction, fraud detection, credit risk management
- **Implementation aspects:** decision support systems, expert systems, information systems, intelligent agents, web service, monitoring, deployment, implementation

Authors should follow the Journal of Applied Mathematics and Decision Sciences manuscript format described at the journal site <http://www.hindawi.com/journals/jamds/>. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at <http://mts.hindawi.com/>, according to the following timetable:

Manuscript Due	December 1, 2008
First Round of Reviews	March 1, 2009
Publication Date	June 1, 2009
