Dedicated to Professor Yukio Matsumoto's sixtieth birthday

Using diagrammatic pictures of tensor contractions, we consider a Hopf algebra $(A_{\text{op}} \otimes^{\mathcal{R}_\lambda} A^*)^*$ twisted by an element $\mathcal{R}_\lambda \in A^* \otimes A_{\text{op}}$ corresponding to a Hopf algebra morphism $\lambda : A \rightarrow A$. We show that this Hopf algebra is quasitriangular with the universal R -matrix coming from \mathcal{R}_λ when $\lambda^2 = \text{id}_A$, generalizing the quantum double construction which corresponds to the case $\lambda = \text{id}_A$.

2000 Mathematics Subject Classification: 17B37, 16W30, 81R50.

1. Introduction. Let A be a Hopf algebra over a field k , and \mathcal{R} the canonical element in $A \otimes_k A^*$ corresponding to the identity map $\text{id}_A : A \rightarrow A$. Let A^* be the dual Hopf algebra of A , and A_{op} the Hopf algebra with the multiplication opposite to that of A , that is, if $\mu_A : A \otimes A \rightarrow A$ and $S_A : A \rightarrow A$ are the multiplication and the antipode of A , then A_{op} has the multiplication $\mu_{A_{\text{op}}}$ and the antipode $S_{A_{\text{op}}}$ defined by $\mu_{A_{\text{op}}}(x \otimes y) := \mu_A(y \otimes x)$ and $S_{A_{\text{op}}}(x) := S_A^{-1}(x)$ for $x, y \in A$, while other structures are the same. Then one can define a Hopf algebra structure on the tensor product $A^* \otimes_k A_{\text{op}}$ by defining the comultiplication and the antipode twisted by \mathcal{R} as

$$\begin{aligned}\Delta(\xi \otimes x) &= \mathcal{R}_{41} \Delta_{13}^{A^*}(\xi) \Delta_{24}^{A_{\text{op}}}(x) \mathcal{R}_{41}^{-1}, \\ S(\xi \otimes x) &= \mathcal{R}_{21}^{-1} (S_{A^*}(\xi) \otimes S_{A_{\text{op}}}(x)) \mathcal{R}_{21}.\end{aligned}\tag{1.1}$$

Other structures, that is, multiplication, unit, and counit, are the usual ones on the tensor product.

Let $D(A) = (A^* \otimes A_{\text{op}})^*$ and let $R \in D(A) \otimes D(A)$ be the image of \mathcal{R} under the mapping $A_{\text{op}} \otimes A^* \rightarrow A_{\text{op}} \otimes 1_{A^*} \otimes 1_A \otimes A_{\text{op}} \rightarrow D(A) \otimes D(A)$. Then $D(A)$ turns out to be a quasitriangular Hopf algebra with the universal R -matrix R .

This is the quantum double construction due to Drinfel'd [2], and it provides an explicit solution to the quantum Yang-Baxter equation (QYBE). The important example is the universal R -matrix of the quantized universal enveloping algebra $U_h(\mathfrak{g})$ which is obtained as the homomorphic image of the universal R -matrix of the quantum double $D(U_h^{\geq 0}(\mathfrak{g}))$ (see [2, 4]). To avoid subtleties concerning Hopf algebra duals or topologies on tensor products for infinite-dimensional algebras and make the basic argument clear, we assume finite dimensionality of Hopf algebras throughout this paper. However, the necessary modifications for some infinite-dimensional cases are standard and will be treated in a subsequent paper.

Although a QYBE a priori has infinitely many solutions, certain uniqueness results can be obtained for R -matrix of the form $\Sigma e^i \otimes e_i$ as in the quantum double construction (see [3, 4]). Hence, to generalize the quantum double construction, we want to consider general elements \mathcal{R}_λ in $A_{\text{op}} \otimes_k A^*$ corresponding to maps $\lambda : A \rightarrow A$. Following the same construction as above using \mathcal{R}_λ in place of \mathcal{R} , we arrive at $D_\lambda(A) = (A_{\text{op}} \otimes^{\mathcal{R}_\lambda} A^*)^*$ which unfortunately fails to be a quasitriangular Hopf algebra for general λ . The purpose of this paper is to show the following theorem.

THEOREM 1.1. *If λ is a bialgebra endomorphism of A such that $\lambda \circ \lambda = \text{id}_A$, then $D_\lambda(A) = (A_{\text{op}} \otimes^{\mathcal{R}_\lambda} A^*)^*$ becomes a quasitriangular Hopf algebra with the universal R -matrix given by the image of \mathcal{R}_λ under the mapping $A_{\text{op}} \otimes A^* \rightarrow A_{\text{op}} \otimes 1_{A^*} \otimes 1_A \otimes A_{\text{op}} \rightarrow D(A) \otimes D(A)$.*

For a Hopf algebra example, if A is commutative and cocommutative, then the antipode $S_A : A \rightarrow A$ becomes a bialgebra isomorphism satisfying $S_A \circ S_A = \text{id}_A$. Another class of examples of such order-2 bialgebra automorphisms may come from the Weyl group acting as a group of reflections on the Cartan subalgebra of a simple Lie group \mathfrak{g} . In fact, this action lifts to an action of a finite covering of the Weyl group on the universal enveloping algebra $U(\mathfrak{g})$ as a group of automorphisms.

The proof would look fairly complicated in the usual formalism of tensor manipulations because of the abundance of tensor components and indices involved. So, we want to present the proof using diagrams representing contraction of indices of various tensors. These diagrams will make the proof more visible and understandable since duality and other symmetry properties of the arguments become rather obvious. So, we begin with writing Hopf algebra structures using these diagrams.

2. Diagrams representing Hopf algebra structures. We write fixed basis elements of A and the dual basis elements of A^* as \downarrow and \uparrow respectively. Hence, A has a basis $\{e^i = \downarrow^{(i)}\}_{i \in I}$ and A^* has the dual basis $\{e_j = \uparrow^{(j)}\}_{j \in I} : \langle \downarrow^{(i)}, \uparrow^{(j)} \rangle = \delta_j^i$.

The multiplication $\mu_A : A \otimes A \rightarrow A$ and the unit $\iota = \iota_A : k \rightarrow A$ are expressed as $\mu_A(\downarrow^{(i)} \otimes \downarrow^{(j)}) = \downarrow^{(ij)}$ and $\iota(1) = 1_A = \sum_i \iota_i e^i = \downarrow^{(i)}$. Hence, the diagram $\downarrow^{(i)(j)}_{(k)}$ represents the coefficient μ_k^{ij} in $\mu_A(e^i \otimes e^j) = \sum_k \mu_k^{ij} e^k$.

The comultiplication $\Delta^A : A \rightarrow A \otimes A$ and the counit $\epsilon = \epsilon^A : A \rightarrow k$ are expressed as $\Delta^A(\downarrow^{(i)}) = \downarrow^{(i)} \otimes \downarrow^{(i)}$ and $\epsilon(\downarrow^{(i)}) = \epsilon^i = \downarrow^{(i)}_{\epsilon}$. Hence, the diagram $\downarrow^{(i)}_{(j)(k)}_{\epsilon}$ represents the coefficient Δ_{jk}^i in $\Delta_A(e^i) = \sum_{j,k} \Delta_{jk}^i e^j \otimes e^k$.

Associativity and unitality, coassociativity and counitality may be expressed in a form where duality is obvious:

$$\begin{aligned} \begin{array}{c} \text{Y-shape (left)} \\ \text{Y-shape (right)} \end{array} &= \begin{array}{c} \text{Y-shape (left)} \\ \text{Y-shape (right)} \end{array} \quad \left(=: \begin{array}{c} \text{Y-shape (left)} \\ \text{Y-shape (right)} \end{array} \right), \quad \begin{array}{c} \text{C-cup (left)} \\ \text{C-cup (right)} \end{array} = \begin{array}{c} \text{C-cup (left)} \\ \text{C-cup (right)} \end{array} = \begin{array}{c} \text{C-cup (left)} \\ \text{C-cup (right)} \end{array}, \\ \begin{array}{c} \text{X-shape (left)} \\ \text{X-shape (right)} \end{array} &= \begin{array}{c} \text{X-shape (left)} \\ \text{X-shape (right)} \end{array} \quad \left(=: \begin{array}{c} \text{X-shape (left)} \\ \text{X-shape (right)} \end{array} \right), \quad \begin{array}{c} \text{C-cap (left)} \\ \text{C-cap (right)} \end{array} = \begin{array}{c} \text{C-cap (left)} \\ \text{C-cap (right)} \end{array} = \begin{array}{c} \text{C-cap (left)} \\ \text{C-cap (right)} \end{array}. \end{aligned} \tag{2.1}$$

Compatibility of algebra and coalgebra structures is

$$\begin{array}{c} \text{Y-shape} \\ \epsilon \end{array} = \begin{array}{c} \text{X-shape} \\ \epsilon \end{array}, \quad \begin{array}{c} \text{Y-shape} \\ \epsilon \end{array} = \begin{array}{c} \text{Y-shape} \\ \epsilon \end{array}, \quad \begin{array}{c} \text{Y-shape} \\ \epsilon \end{array} = \begin{array}{c} \text{Y-shape} \\ \epsilon \end{array}. \quad (2.2)$$

The antipode $S_A : A \rightarrow A$ is written as $S \downarrow$ and satisfies

$$S \downarrow = \begin{array}{c} \epsilon \downarrow \\ \epsilon \downarrow \end{array} = \begin{array}{c} \epsilon \downarrow \\ \epsilon \downarrow \end{array} S, \quad (2.3)$$

where S is an antiautomorphism of the Hopf algebra A :

$$\begin{array}{c} \text{Y-shape} \\ S \downarrow \end{array} = S \downarrow \begin{array}{c} \text{X-shape} \\ S \downarrow \end{array}, \quad \begin{array}{c} \text{Y-shape} \\ S \downarrow \end{array} = S \downarrow \begin{array}{c} \text{X-shape} \\ S \downarrow \end{array}, \quad (2.4)$$

$$\begin{array}{c} \text{Y-shape} \\ S \downarrow \end{array} = \begin{array}{c} \text{Y-shape} \\ S \downarrow \end{array}, \quad \begin{array}{c} \text{Y-shape} \\ S \downarrow \end{array} = \begin{array}{c} \text{Y-shape} \\ S \downarrow \end{array}.$$

In general, a linear map $f : A \rightarrow A$ is written as $f \left(\begin{array}{c} \epsilon \\ \epsilon \end{array} \right) = f \left(\begin{array}{c} \epsilon \\ \epsilon \end{array} \right)$, expressing $f(e^i) = \sum_j f_j^i e^j$.

A linear map f is an algebra homomorphism when

$$\begin{array}{c} \text{Y-shape} \\ f \downarrow \end{array} = f \downarrow \begin{array}{c} \text{X-shape} \\ f \downarrow \end{array}, \quad \begin{array}{c} \text{Y-shape} \\ f \downarrow \end{array} = \begin{array}{c} \text{Y-shape} \\ f \downarrow \end{array}. \quad (2.5)$$

A linear map f is a coalgebra homomorphism when

$$\begin{array}{c} \text{Y-shape} \\ f \downarrow \end{array} = f \downarrow \begin{array}{c} \text{X-shape} \\ f \downarrow \end{array}, \quad \begin{array}{c} \text{Y-shape} \\ f \downarrow \end{array} = \begin{array}{c} \text{Y-shape} \\ f \downarrow \end{array}. \quad (2.6)$$

Note that related Hopf algebras A^* , A_{op} , A^{op} , and so forth can be expressed by using the same components of the diagram for A . For example, the multiplication μ_{A^*} of the dual Hopf algebra A^* is the transpose of the comultiplication Δ^A of A which is specified by the coefficients $\left(\begin{array}{c} \epsilon \\ \epsilon \end{array} \right)$ of $\Delta^A(e^i)$. Hence, $\mu_{A^*} \left(\begin{array}{c} \epsilon \\ \epsilon \end{array} \otimes \begin{array}{c} \epsilon \\ \epsilon \end{array} \right) = \begin{array}{c} \epsilon \\ \epsilon \end{array}$. Similarly, $\Delta^{A^*} \left(\begin{array}{c} \epsilon \\ \epsilon \end{array} \right) = \left(\begin{array}{c} \epsilon \\ \epsilon \end{array} \right)$, and $\mu_{A_{\text{op}}} \left(\begin{array}{c} \epsilon \\ \epsilon \end{array} \otimes \begin{array}{c} \epsilon \\ \epsilon \end{array} \right) = \begin{array}{c} \epsilon \\ \epsilon \end{array}$, and so forth.

3. Proof of the theorem. Let $\lambda : A \rightarrow A$ be a bialgebra endomorphism and let $\mathcal{R}_\lambda \in A \otimes A^*$ be the element corresponding to $\lambda : \mathcal{R}_\lambda = \sum \lambda_i^j e^i \otimes e_j$. Diagrammatically, $\mathcal{R}_\lambda =$

$$\begin{array}{c} \text{Y-shape} \\ \lambda \downarrow \end{array}.$$

LEMMA 3.1. *The element \mathcal{R}_λ is an invertible element of $A_{\text{op}} \otimes A^*$ satisfying the following relations:*

$$\begin{aligned} (\text{id} \otimes \Delta^{A^*})(\mathcal{R}_\lambda) &= (\mathcal{R}_\lambda)_{13}(\mathcal{R}_\lambda)_{12}, & (\Delta^{A_{\text{op}}} \otimes \text{id})(\mathcal{R}_\lambda) &= (\mathcal{R}_\lambda)_{13}(\mathcal{R}_\lambda)_{23}, \\ (\text{id} \otimes S^{A^*-1})(\mathcal{R}_\lambda) &= \mathcal{R}_\lambda^{-1}, & (S^{A_{\text{op}}} \otimes \text{id})(\mathcal{R}_\lambda) &= \mathcal{R}_\lambda^{-1}. \end{aligned} \quad (3.1)$$

PROOF.

$$\begin{aligned} (\text{id} \otimes \Delta^{A^*})(\mathcal{R}_\lambda) &= \text{diagram} = \text{diagram} \\ &= \text{diagram} = (\mathcal{R}_\lambda)_{13}(\mathcal{R}_\lambda)_{12}. \end{aligned} \quad (3.2)$$

This proves the first equality.

$$\begin{aligned} (S^{A_{\text{op}}} \otimes \text{id})(\mathcal{R}_\lambda)\mathcal{R}_\lambda &= \left(\text{diagram} \right) \left(\text{diagram} \right) = \text{diagram} \\ &= \text{diagram} = \text{diagram} = \text{diagram} \\ &= 1_{A_{\text{op}} \otimes A^*}. \end{aligned} \quad (3.3)$$

Here we used $S^{-1} \text{diagram} = \text{diagram}$.

The remaining equalities may be similarly verified. \square

On the tensor product $A^* \otimes_k A_{\text{op}}$ we define the multiplication \mathcal{M} , the comultiplication Δ_λ , the unit \mathcal{I} , the counit \mathcal{E} , and the antipode S_λ as follows:

$$\begin{aligned} \mathcal{M}((\xi \otimes x) \otimes (\eta \otimes y)) &= (\xi \otimes x)(\eta \otimes y) = \mu_{A^*}(\xi \otimes x) \otimes \mu_{A_{\text{op}}}(\eta \otimes y), \\ \Delta_\lambda(\xi \otimes x) &= (\mathcal{R}_\lambda)_{41} \Delta_{13}^{A^*}(\xi) \Delta_{24}^{A_{\text{op}}}(x) (\mathcal{R}_\lambda)_{41}^{-1}, \\ \mathcal{I}(1) &= \epsilon^A \otimes \iota_A = 1_{A^* \otimes A_{\text{op}}}, & \mathcal{E}(\xi \otimes x) &= \xi(1_A) \epsilon^A(x), \\ S_\lambda(\xi \otimes x) &= (\mathcal{R}_\lambda^{-1})_{21} (S_{A^*}(\xi) \otimes S_{A_{\text{op}}}(x)) (\mathcal{R}_\lambda)_{21}, \\ & \text{(for } \xi, \eta \in A^*, x, y \in A_{\text{op}}). \end{aligned} \quad (3.4)$$

Hence, the comultiplication and the antipode are twisted by λ , while other structures are the usual ones on the tensor product.

As $\mathcal{R}_\lambda^{-1} = \begin{array}{c} S^{-1} \\ \lambda \otimes \end{array}$ from Lemma 3.1, the twisted comultiplication may be written diagrammatically as

$$\Delta_\lambda \left(\begin{array}{c} \blacksquare \\ (i) \end{array} \otimes \begin{array}{c} \blacksquare \\ (j) \end{array} \right) = \begin{array}{c} \begin{array}{c} \blacksquare \otimes \blacksquare \\ \lambda \end{array} \begin{array}{c} \blacksquare \otimes \blacksquare \\ S^{-1} \end{array} \end{array} \quad (3.5)$$

Similarly,

$$S_\lambda \left(\begin{array}{c} \blacksquare \\ (i) \end{array} \otimes \begin{array}{c} \blacksquare \\ (j) \end{array} \right) = \begin{array}{c} \begin{array}{c} \blacksquare \otimes \blacksquare \\ \lambda \end{array} \begin{array}{c} \blacksquare \otimes \blacksquare \\ S^{-1} \end{array} \end{array} \quad (3.6)$$

PROPOSITION 3.2 (see [1, 2, 4]). *The system $(A^* \otimes A_{\text{op}}, \mathcal{M}, \mathcal{F}, \Delta_\lambda, \mathcal{E}, S_\lambda)$ is a Hopf algebra.*

PROOF. This is a standard fact. More generally, if an invertible element $\mathcal{R} \in C \otimes B$ satisfies the conclusion of Lemma 3.1, namely,

$$\begin{aligned} (\text{id} \otimes \Delta^B)(\mathcal{R}) &= \mathcal{R}_{13} \mathcal{R}_{12}, & (\Delta^C \otimes \text{id})(\mathcal{R}) &= \mathcal{R}_{13} \mathcal{R}_{23}, \\ (\text{id} \otimes (S^B)^{-1})(\mathcal{R}) &= \mathcal{R}^{-1}, & (S^C \otimes \text{id})(\mathcal{R}) &= \mathcal{R}^{-1}, \end{aligned} \quad (3.7)$$

then $B \otimes C$ becomes a Hopf algebra with the structures defined as above. The verification of Hopf algebra conditions may be a little tedious but can be done without difficulty. Hence we omit it.

Let $D_\lambda(A) = ((A^* \otimes^{\mathcal{R}_\lambda} A_{\text{op}})^*, \mathcal{M}_D, \mathcal{F}_D, \Delta^D, \mathcal{E}^D, S_D)$ be the dual Hopf algebra of $(A^* \otimes A_{\text{op}}, \mathcal{M}, \mathcal{F}, \Delta_\lambda, \mathcal{E}, S_\lambda)$ and let $R_\lambda \in D_\lambda(A) \otimes D_\lambda(A)$ be the image of $\mathcal{R}_\lambda \in A \otimes A^*$ under the map $A \otimes A^* \rightarrow A \otimes 1_A^* \otimes 1_A \otimes A^* \rightarrow D_\lambda(A)$. We now assume $\lambda \circ \lambda = \text{id}_A$. We want to show that $(D_\lambda(A), R_\lambda)$ is quasitriangular, that is, we need to check the following conditions:

$$\begin{aligned} (\text{id} \otimes \Delta^D)(R_\lambda) &= (R_\lambda)_{13} (R_\lambda)_{12}, & (\Delta^D \otimes \text{id})(R_\lambda) &= (R_\lambda)_{13} (R_\lambda)_{23}, \\ R_\lambda \Delta^D(x) &= \Delta^{D_{\text{op}}}(x) R_\lambda \quad \text{for } x \in D_\lambda(A), \end{aligned} \quad (3.8)$$

where $\Delta^{D_{\text{op}}}$ is the opposite of the comultiplication Δ^D .

We will give a proof for the last equality. The first two equalities can be verified easily.

Noting that the multiplication \mathcal{M}_D of $D_\lambda(A)$ is the dual of the comultiplication Δ_λ of $A^* \otimes A_{\text{op}}$, whose diagrammatic description is given at the end of [Section 2](#), we see that

$$\begin{aligned} & \Delta^{D_{\text{op}}} \left(\begin{array}{c} (a) \\ \blacksquare \downarrow \\ \otimes \quad \blacksquare \\ \quad \downarrow (b) \end{array} \right) R_\lambda \\ &= \left(\begin{array}{c} (a) \\ \text{loop} \\ \blacksquare \otimes \blacksquare \otimes \blacksquare \otimes \blacksquare \\ \quad \downarrow (b) \end{array} \right) \left(\begin{array}{c} \lambda \quad \quad \quad \iota \\ \blacksquare \otimes \blacksquare \otimes \blacksquare \otimes \blacksquare \\ \quad \downarrow \epsilon \end{array} \right) \\ &= \begin{array}{c} (a) \\ \text{loop} \\ \lambda \cdot \text{---} \blacksquare \otimes \blacksquare \otimes \blacksquare \otimes \blacksquare \text{---} \iota \\ \quad \downarrow S^{-1} \epsilon \end{array} \\ &= \begin{array}{c} (a) \\ \text{loop} \\ \lambda \cdot \text{---} \blacksquare \otimes \blacksquare \otimes \blacksquare \otimes \blacksquare \text{---} \iota \\ \quad \downarrow S^{-1} \epsilon \end{array} \end{aligned}$$

(by the counitality of the multiplication)

(by associativity and coassociativity)

here we used

$$\left(\begin{array}{c} \text{diagram of a box with two loops and labels } \lambda, S^{-1}, \lambda \\ \epsilon \\ \iota \end{array} \right)$$

From the symmetry between this diagram and the first one and using the duality between the associativity and coassociativity, and so forth, we can modify this diagram in exactly the same way and obtain the same final diagram as above. This completes the proof of [Theorem 1.1](#).

Special Issue on Time-Dependent Billiards

Call for Papers

This subject has been extensively studied in the past years for one-, two-, and three-dimensional space. Additionally, such dynamical systems can exhibit a very important and still unexplained phenomenon, called as the Fermi acceleration phenomenon. Basically, the phenomenon of Fermi acceleration (FA) is a process in which a classical particle can acquire unbounded energy from collisions with a heavy moving wall. This phenomenon was originally proposed by Enrico Fermi in 1949 as a possible explanation of the origin of the large energies of the cosmic particles. His original model was then modified and considered under different approaches and using many versions. Moreover, applications of FA have been of a large broad interest in many different fields of science including plasma physics, astrophysics, atomic physics, optics, and time-dependent billiard problems and they are useful for controlling chaos in Engineering and dynamical systems exhibiting chaos (both conservative and dissipative chaos).

We intend to publish in this special issue papers reporting research on time-dependent billiards. The topic includes both conservative and dissipative dynamics. Papers discussing dynamical properties, statistical and mathematical results, stability investigation of the phase space structure, the phenomenon of Fermi acceleration, conditions for having suppression of Fermi acceleration, and computational and numerical methods for exploring these structures and applications are welcome.

To be acceptable for publication in the special issue of Mathematical Problems in Engineering, papers must make significant, original, and correct contributions to one or more of the topics above mentioned. Mathematical papers regarding the topics above are also welcome.

Authors should follow the Mathematical Problems in Engineering manuscript format described at <http://www.hindawi.com/journals/mpe/>. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at <http://mts.hindawi.com/> according to the following timetable:
