ABSTRACT. The general diophantine equations of the second and third
degree are far from being totally solved. The equations considered in
this paper are

  i) $x^2 - my^2 = \pm 1$

  ii) $x^3 + my^3 + m^2 z^3 - 3 mxyz = 1$

  iii) Some fifth degree diophantine equations

Infinitely many solutions of each of these equations will be
stated explicitly, using the results from the ACF discussed before.

It is known that the solutions of Pell's equation are well
exploited. We include it here because we shall use a common method to
solve these three above mentioned equations and the method becomes very
simple in Pell's equations case.

Some new third and fifth degree combinatorial identities are
derived from units in algebraic number fields.

KEY WORDS AND PHRASES. Diophantine equations, identities, an algorithm
in a complex field (abbr. ACF), units in the algebraic number fields.
1980 MATHEMATICS SUBJECT CLASSIFICATION CODE. 10B10, 10B15, 10A30, 12A45.

0. INTRODUCTION

In this paper we shall investigate Diophantine equations of the
second and third degree of a special type. The general equations of
the second and third degrees are far from being totally solved. It
suffices to look up Mordell's book on Diophantine equations, to learn
how little we actually know about the general second and third degree
Diophantine equations, in spite of the many numerous results on this
subject that have been gained by great mathematicians with no little
effort. The famous Thue theorem stating that the equation

  $a_0 x^n + a_1 x^{n-1} y + \cdots a_{n-1} xy^{n-1} + a_n y^n = c$

  (a_i, c rational integers, i = 0,1,...,n; n > 2)

has only a finite number of (rational) solutions is an amazing dis-
covery. It leaves open the question how to find these solutions and
what is their exact number, and one would conjecture that it will
remain open for (all) times to come.

The equations considered in this part of the paper are:

i) The equation, known (wrongly) as Pell's equation, namely

$$x^2 - my^2 = \pm 1,$$

ii) The equation $x^3 + my^3 + m^2z^3 - 3m\,x\,y\,z = 1,$

iii) and

$$\begin{vmatrix} x & y & z & u & v \\ mv & x & y & z & u \\ mu & mv & x & y & z \\ mz & mu & mv & x & y \\ my & mz & mu & mv & x \end{vmatrix} = 1.$$

Infinitely many solutions of each of these equations will be stated
explicitly. Now, it is known that the solutions of Pell's equations
is well exploited. Still, we found it necessary to include it here
because of the simple method we shall use in solving this equation
here, which has such a wide range of application in various branches
of exact sciences. Also, we will derive some new combinatorial
identities.

Since we are going to use some formulas obtained by the author in
some previous papers [1] and [2] we introduce them here

$$\left.\begin{aligned} A_0^{(0)} &= 1, \quad A_0^{(1)} = 0, \quad A_0^{(n+2)} = A_0^{(n)} + 2DA_0^{(n+1)} \\ A_1^{(0)} &= 0, \quad A_1^{(1)} = 1, \quad A_1^{(n+2)} = A_1^{(n)} + 2DA_1^{(n+1)} \\ n &= 0,1,\ldots \end{aligned}\right\} \tag{0.1}$$

$$A_1^{(v+1)} = A_0^{(v)} + 2DA_0^{(v+1)} = A_1^{(v+2)}. \tag{0.2}$$

$$A_0^{(2n)} = \sum_{i=0}^{n-1} \binom{2n-2-i}{i}(2D)^{2n-2-2i}, \quad n = 1,2,\ldots \tag{0.3}$$

$$\text{for } n \Rightarrow 2n-1.$$

$$A_0^{(2n+1)} = \sum_{i=0}^{n-1} \binom{2n-1-i}{i}(2D)^{2n-1-2i}, \quad n = 1,2,\ldots \tag{0.4}$$

$$e^f = A_0^{(f\ell)} + a_1^{(0)} A_0^{(f\ell+1)} + \cdots + a_{n-1}^{(0)} A_0^{(f\ell+n-1)}, \quad f = 1,2,\ldots \tag{0.5}$$

$$\begin{vmatrix} A_0^{(v)}, & A_0^{(v+1)}, \ldots, & A_0^{(v+n-1)} \\ A_1^{(v)}, & A_1^{(v+1)}, \ldots, & A_1^{(v+n-1)} \\ \text{-- -- -- -- -- -- -- -- -- --} \\ A_{n-1}^{(v)}, & A_{n-1}^{(v+1)}, \ldots, & A_{n-1}^{(v+n-1)} \end{vmatrix} = (-1)^{v(n-1)} \tag{0.6}$$

$$\left.A_0^{(0)} = 1, \quad A_0^{(1)} = A_0^{(2)} = 0, \quad A_0^{(n+3)} = A_0^{(n)} + 3DA_0^{(n+1)} + 3D^2A_0^{(n+2)}\right\} \tag{0.7}$$

$$n = 0,1,\ldots$$

$$A_1^{(n+2)} = A_0^{(n+1)} + 3DA_0^{(n+2)} \tag{0.8}$$

$$A_2^{(n+2)} = A_0^{(n)} + 3DA_0^{(n+1)} + 3D^2A_0^{(n+2)} \tag{0.9}$$

$$\prod_{i=1}^{k} a_{n-1}^{(i)} = A_0^{(k)} + a_1^{(k)}A_0^{(k+1)} + \cdots + a_{n-1}^{(k)}A_0^{(k+n-1)} \tag{0.10}$$

$$\left.\begin{array}{l} A_0^{(n+3)} = \sum_{3y_1+2y_2+y_3=n} \begin{pmatrix} y_1+y_2+y_3 \\ y_1,y_2,y_3 \end{pmatrix} 3^{y_2+y_3} D^{y_2+2y_3} \\ \\ n = 0,1,\ldots; \; \begin{pmatrix} 0 \\ 0 \end{pmatrix} \equiv 1 \end{array}\right\} \tag{0.11}$$

$$\left.\begin{array}{l} A_0^{(0)} = 1, \; A_0^{(1)} = A_0^{(2)} = A_0^{(3)} = A_0^{(4)} = 0. \\ \\ A_0^{(n+5)} = A_0^{(n)} + 5DA_0^{(n+1)} + 10D^2A_0^{(n+2)} + 10D^3A_0^{(n+3)} + 5D^4A_0^{(n+4)} \\ \\ n = 0,1,\ldots \end{array}\right\} \tag{0.12}$$

1. PELL'S EQUATION

We denote

$$\left.\begin{array}{l} w^2 = D^2 + 1 = m, \; w = \sqrt{D^2 + 1}, \\ \\ D \in N, \; m \text{ not a perfect square.} \end{array}\right\} \tag{1.1}$$

We obtain from (0.6) with $n = 2$,

$$\left.\begin{array}{l} \begin{vmatrix} A_0^{(n)} & A_0^{(n+1)} \\ A_1^{(n)} & A_1^{(n+1)} \end{vmatrix} = (-1)^{(2-1)n} \\ \\ n = 0,1,\ldots \end{array}\right\} \tag{1.2}$$

and from (0.1), (0.2)

$$\begin{vmatrix} A_0^{(n)} & A_0^{(n+1)} \\ A_0^{(n+1)} & A_0^{(n+2)} \end{vmatrix} = \begin{vmatrix} A_0^{(n)} & A_0^{(n+1)} \\ A_0^{(n+1)} & A_0^{(n)}+2DA_0^{(n+1)} \end{vmatrix} =$$

$$A_0^{(n)2} + 2DA_0^{(n)}A_0^{(n+1)} - A_0^{(n+1)2} = (A_0^{(n)} + DA_0^{(n+1)})^2 - (D^2+1)A_0^{(n+1)2},$$

$$(A_0^{(n)} + DA_0^{(n+1)})^2 - m\,A_0^{(n+1)2} = (-1)^n. \tag{1.3}$$

We have obtained Pell's equations

$$\left.\begin{array}{l} x_n^2 - my_n^2 = (-1)^n, \quad n = 0,1,\ldots \\ \\ x_n = A_0^{(n)} + DA_0^{(n+1)}, \; y_n = A_0^{(n+1)} \end{array}\right\} \tag{1.4}$$

$$\left.\begin{array}{l} x_{2n} = A_0^{(2n)} + DA_0^{(2n+1)}, \; y_{2n} = A_0^{(2n+1)} \\ \\ x_{2n}^2 - m\,y_{2n}^2 = 1. \end{array}\right\} \tag{1.5}$$

$$\left.\begin{array}{l} x_{2n+1} = A_0^{(2n+1)} + DA_0^{(2n+2)}, \; y_{2n+1} = A_0^{(2n+2)} \\ \\ x_{2n+1}^2 - m\,y_{2n+1}^2 = -1. \end{array}\right\} \tag{1.6}$$

Thus we have obtained infinitely many solutions of $x^2 - my^2 = \pm 1$, and, as is known from the theory of continued fractions, these are <u>all</u> solutions of these two equations, the so-called plus and minus cases of Pell's equations.

With (0.3), (0.4), formulas (1.5), (1.6) take the forms

$$x_{2n} = \sum_{i=0}^{n-1} \binom{2n-2-i}{i}(2D)^{2n-2-2i} + \frac{1}{2}\binom{2n-1-i}{i}(2D)^{2n-2i},$$

$$y_{2n} = \sum_{i=0}^{n-1} \binom{2n-1-i}{i}(2D)^{2n-1-2i},$$

$$x_{2n}^2 - m\,y_{2n}^2 = 1, \quad n = 0,1,\dots$$

$$x_{2n+1} = \sum_{i=0}^{n-1} \binom{2n-1-i}{i}(2D)^{2n-1-2i} + \sum_{i=0}^{n} \binom{2n-i}{i}(2D)^{2n+1-2i},$$

$$y_{2n+1} = \sum_{i=1}^{n} \binom{2n-i}{i}(2D)^{2n-2i}, \quad n = 0,1,\dots$$

$$x_{2n+1}^2 - m\,y_{2n+1}^2 = -1.$$

With the calculations of $A_0^{(v)}$ from Ch. 0, we have

$$x_0 = A_0^{(0)} + DA_0^{(1)} = A_0^{(0)} = 1; \quad A_0^{(1)} = y_1 = 0,$$

$$x_0^2 = my_0^2 = 1^2 - (D^2+1) \cdot 0 = 1.$$

$$x_1 = A_0^{(1)} + DA_0^{(2)} = D; \quad y_1 = A_0^{(2)} = 1,$$

$$x_1^2 - my_1^2 = D^2 - (D^2+1) \cdot 1 = -1.$$

$$x_2 = A_0^{(2)} + DA_0^{(3)} = 1 + 2D^2; \quad y_2 = 2D,$$

$$x_2^2 - m\,y_2^2 = (1+2D^2)^2 + (1+D^2) \cdot 4D^2 = 1.$$

$$x_3 = A_0^{(3)} + DA_0^{(4)} = 3D+4D^3; \quad y_3 = 1+4D^2,$$

$$x_3^2 - m\,y_3^2 = (3D+4D^3)^2 - (1+D^2)(1+4D^2)^2 = -1,$$

$$x_4 = 1 + 8D^2 + 8D^4; \quad y_4 = 4D + 8D^3,$$

$$x_4^4 - m\,y_4^2 = (1 + 8D^2 + 8D^4)^2 - (1+D^2)(4D + 8D^3)^2 = 1.$$

2.   UNITS IN $Q(w)$, $w = \sqrt{D^2+1}$

It is clear that

$$e = w + D \qquad\qquad (2.1)$$

is a unit in $Q(w)$. For e is an integer, and $e^{-1} = w - D$, an integer.

The ACF [1] of $a^{(0)} = w + D$ is purely periodic with length of its primitive period $\ell = 1$; hence we have from formula (0.5)

$$e^n = (w+D)^n = A_0^{(n)} + (w+D)A_0^{(n+1)}. \qquad\qquad (2.2)$$

From (2.2) we get an interesting combinatorial identity

$$(w+D)^{2n} = A_0^{(2n)} + (w+D)A_0^{(2n+1)}$$
$$(w+D)^{2n} = A_0^{(2n)} + DA_0^{(2n+1)} + wA_0^{(2n+1)},$$

hence from (1.5)

$$(w+D)^{2n} = x_{2n} + y_{2n} \, w. \tag{2.3}$$

With $w^2 = D^2+1 = m$, the reader will easily verify the formulas

$$(w+D)^{2n} = \left(\sum_{i=0}^{n} \binom{2n}{2i} D^{2i} m^{n-i} \right) + \left(\sum_{i=0}^{n-1} \binom{2n}{2i+1} D^{2i+1} m^{n-1-i} \right) w. \tag{2.4}$$

From (2.3) and (2.4), and using the expressions for x_{2n} and y_{2n} from the previous paragraph, we obtain the combinatorial identities

$$\left. \begin{array}{l} \displaystyle\sum_{i=0}^{n-1} \left[\binom{2n-2-i}{i}(2D)^{2n-2-2i} + \frac{1}{2}\binom{2n-1-i}{i}(2D)^{2n-2i} \right] \\[2ex] = \displaystyle\sum_{i=0}^{n} \binom{2n}{2i} D^{2i}(D^2+1)^{n-i}. \end{array} \right\} \tag{2.5}$$

$$\sum_{i=0}^{n-1} \binom{2n-1-i}{i}(2D)^{2n-1-2i} = \sum_{i=0}^{n-1} \binom{2n}{2i+1} D^{2i+1}(D^2+1)^{n-1-i}. \tag{2.6}$$

Similar identities are obtainable from

$$(w+D)^{2n+1} = x_{2n+1} + y_{2n+1} \, w.$$

3.   THE CUBIC DIOPHANTINE EQUATIONS

We shall need formulas (0.6), (0.7), (0.8), (0.9) for $n = 3$, viz.

$$\begin{vmatrix} A_0^{(n+1)} & A_0^{(n+2)} & A_0^{(n+3)} \\ A_1^{(n+1)} & A_1^{(n+2)} & A_1^{(n+3)} \\ A_2^{(n+1)} & A_2^{(n+2)} & A_2^{(n+3)} \end{vmatrix} = 1 \tag{3.1}$$

$$\left. \begin{array}{l} A_0^{(0)} = 1, \quad A_0^{(1)} = A_0^{(2)} = 0, \\[1ex] A_0^{(n+3)} = A_0^{(n)} + 3DA_0^{(n+1)} + 3D^2 A_0^{(n+2)}, \\[1ex] A_1^{(n+3)} = A_0^{(n+2)} + 3DA_0^{(n+3)} \\[1ex] A_2^{(n+3)} = A_0^{(n+1)} + 3DA_0^{(n+2)} + 3D^2 A_0^{(n+3)}. \end{array} \right\} \tag{3.2}$$

Substituting in (3.1) the values for $A_1^{(i)}$, $A_2^{(i)}$, $i = n+3$ from (3.2), we obtain, after simple rearrangements

$$1 = \begin{vmatrix} A_0^{(n+1)} & A_0^{(n+2)} & A_0^{(n+3)} \\[1ex] A_0^{(n)}+3DA_0^{(n+1)} & A_0^{(n+1)}+3DA_0^{(n+2)} & A_0^{(n+2)}+3DA_0^{(n+3)} \\[1ex] A_0^{(n+1)}+3DA_0^{(n)}+3D^2A_0^{(n+1)} & A_0^{(n)}+3DA_0^{(n+1)}+3D^2A_0^{(n+2)} & A_0^{n+1}+3DA_0^{n+2}+3D^2A_0^{(n+3)} \end{vmatrix}$$

$$= \begin{vmatrix} A_0^{(n+1)} & A_0^{(n+2)} & A_0^{(n+3)} \\ A_0^{(n)} & A_0^{(n+1)} & A_0^{(n+2)} \\ A_0^{(n-1)} & A_0^{(n)} & A_0^{(n+1)} \end{vmatrix} .$$

We now denote
$$x = A_0^{(n-1)}, \quad y = A_0^{(n)}, \quad z = A_0^{(n+1)}$$
$$n = 1, 2, \ldots .$$
(3.3)

and obtain for the above determinant

$$1 = \begin{vmatrix} z & x + 3Dy + 3D^2z & y + 3Dz + 3D^2A_0^{(n+3)} \\ y & z & A_0^{(n+2)} \\ x & y & z \end{vmatrix} .$$

Subtracting from the first row the 3D multiple of the third and the $3D^2$ of the second, we obtain,

$$\begin{vmatrix} 2-3Dx-3D^2y & x & y \\ y & \cdot & z & x+3Dy+3D^2z \\ x & y & z \end{vmatrix} = 1.$$
(3.4)

We leave it to the reader to expand the determinant in (3.4) to obtain the Diophantine equation of the third degree as

$$x^3 + (9D^3+1)y^3 + z^3 + (9D^3-3)xyz + 6Dx^2y + 3D^2x^2z$$
$$+ 12D^2y^2x + (9D^4-3D)y^2z - 3Dz^2x - 6D^2z^2y = 1.$$
(3.5)

Even for $D = 1$, equation (3.5) has a complicated form as

$$x^3 + 10y^3 + z^3 + 6xyz + 6x^2y + 3x^2z + 12y^2x$$
$$+ 6y^2z - 3z^2x - 6z^2y = 1.$$
(3.6)

In [2] we have calculated the solution triples $A_0^{(n)}$, $A_0^{(n+1)}$, $A_0^{(n+2)}$, $n = 0,1,\ldots$

$$(x,y,z) = (1,0,0), \ (0,0,1), \ (0,1,3), \ (1,3,12),$$
$$(3,12,46), \ (12,46,177).$$

We shall check the solution
$$(x_3, y_3, z_3) = (1,3,12).$$

Substituting these values in (3.6), we obtain $1 + 270 + 1728 + 216 + 18 + 36 + 108 + 648 - 432 - 2592 = 1$, $3025 - 3024 = 1$.

For larger values of D and n the verification of (3.5) is only possible by computer, and without knowing (3.3) even a computer would have its problems.

As we shall soon see, there is a much simpler third degree Diophantine equation which can be regarded as, and indeed in a certain case represents, a generalization of Pell's equation to the third degree.

4. UNITS IN THE CUBIC FIELD

As we have seen in [1], the ACF of the vector $a^{(0)} \in E_3$, with $w = \sqrt[3]{D^3+1}$, $D \in N$, $a^{(0)} = (w+2D, \ w^2+Dw+D^2)$, is purely periodic with length of primitive period $\ell = 1$. Hence, by theorem 2 in [2] and formula (0.10)

$$e = w^2 + Dw + D^2 \tag{4.1}$$

is a unit in $Q(w)$, and

$$\left.\begin{aligned}
e^v &= A_0^{(v)} + (w+2D)A_0^{(v+1)} + (w^2+Dw+D^2)A_0^{(v+2)} \\
&\qquad v = 0,1,\dots \ .
\end{aligned}\right\} \tag{4.2}$$

Thus

$$\left.\begin{aligned}
(w^2+Dw+D^2)^v &= A_0^{(v)} + 2DA_0^{(v+1)} + D^2A_0^{(v+2)} \\
&\quad + (A_0^{(v+1)} + DA_0^{(v+2)})w + D^2A_0^{(v+2)}w^2.
\end{aligned}\right\} \tag{4.3}$$

We shall find the field equation of the expressions (1.3) in $Q(w)$.

We denote

$$\left.\begin{aligned}
x_v &= A_0^{(v)} + 2DA_0^{(v+1)} + D^2A_0^{(v+2)}, \\
y_v &= A_0^{(v+1)} + DA_0^{(v+2)} \\
z_v &= A_0^{(v+2)},
\end{aligned}\right\} \tag{4.4}$$

and have

$$\left.\begin{aligned}
e^v &= x_v + y_v w + z_v w^2 \\
we^v &= mz_v + x_v w + y_v w^2 \\
w^2 e^v &= my_v + mz_v w + x_v w^2, \\
&\quad m = w^3 = D^3+1.
\end{aligned}\right\} \tag{4.5}$$

Hence

$$\begin{vmatrix} x_v & y_v & z_v \\ mz_v & x_v & y_v \\ my_v & mz_v & x_v \end{vmatrix} = 1, \tag{4.6}$$

since $N(e) = 1$, as the reader will easily verify.

Expanding the determinant in (4.6), we obtain

$$\left.\begin{aligned}
x_v^3 + my_v^3 + m^2 z_v^3 - 3m x_v y_v z_v &= 1 \\
x_v, y_v, z_v \text{ from (4.4), } v &= 0,1,\dots \ .
\end{aligned}\right\} \tag{4.7}$$

The Diophantine equation

$$x^3 + my^3 + m^2 z^3 - 3m \ xyz = 1$$

is indeed Pell's equation generalized to the third dimension. It is simpler compared with (3.6) and it has as solutions (4.4).

We shall verify formula (4.5), first line for $v = 1,2$. We have, from (4.4),

$$x_1 = A_0^{(1)} + 2DA_0^{(2)} + D^2A_0^{(3)} = D^2,$$

$$y_1 = A_0^{(2)} + DA_0^{(3)} = D,$$

$$z_1 = A_0^{(3)} = 1.$$

$$(D^2)^3 + (D^3+1)D^3 + (D^3+1)^2 \cdot 1 - 3(D^3+1)D^2 \cdot D =$$

$$D^6 + D^6 + D^3 + D^6 + 2D^3 + 1 - 3D^6 - 3D^3 = 1;$$

$$x_2 = A_0^{(2)} + 2DA_0^{(3)} + D^2A_0^{(4)}$$

$$x_2 = 2D + D^2 \cdot 3D^2 = 2D + 3D^4,$$

$$y_2 = A_0^{(3)} + DA_0^{(4)} = 1 + 3D^3$$

$$z_2 = A_0^{(4)} = 3D^2.$$

We obtain substituting (x_2, y_2, z_2) in (4.7)

$$1 + 18D^3 + 99D^6 + 162D^9 + 81D^{12} - 3(6D^3 + 33D^6 + 54D^9 + 27D^{12}) = 1.$$

We shall now extract a few interesting identities from Formula (4.3). We have, by the binomial theorem,

$$(w^2 + Dw + D^2)^{3n} = \sum_{i=0}^{3n} (w^2)^{2n-i}(Dw + D^2)^i =$$

$$= \sum_{i=0}^{3n} \binom{3n}{i} w^{6n-2i} \sum_{j=0}^{i} \binom{i}{j}(Dw)^{i-j}D^{2j} =$$

$$= \sum_{\substack{i=0 \\ j=0,1,\ldots,i}}^{3n} \binom{3n}{i} w^{6n-2i} \binom{i}{j} D^{i+j} w^{i-j} =$$

$$= \sum_{\substack{i=0 \\ j=0,1,\ldots,i}}^{3n} \binom{3n}{i}\binom{i}{j} w^{6n-(i+j)} D^{i+j}.$$

In the sum $\sum \binom{3n}{i}\binom{i}{j} w^{6n-(i+j)} D^{i+j}$, $i = 0,1,\ldots,3n$; $j = 0,1,\ldots,i$; we want to find the coefficient of powers of w^{3n}, so that since $w^3 = m = D^3+3$, this sum becomes rational. For this purpose we have to set $i+j \equiv 0(3)$ and obtain

$$(w^2 + Dw + D^2)^{3n} =$$

$$\left. \sum_{\substack{i+j=3s \leq 6n \\ s=0,1,\ldots,2n \\ 0 \leq j \leq i \leq 3n}} \binom{3n}{i}\binom{i}{j} w^{6n-3s} D^{3s} \right\} \quad (4.8)$$

(4.8) is an appealing formula for the expression $(w^2+Dw+D^2)^{3n}$, though this expression could also be calculated by the multinomial theorem. We have, in order to illustrate its application; $n=1$, $s=0,1,2$.

$$s = 0; \ i = j = 0;$$
$$s = 1; \ i = 2, \ j = 1; \ i = 3, \ j = 0;$$
$$s = 2; \ i = 3, \ j = 3. \quad (i \leq 3).$$

Hence we have for the rational part of e^3:

$$(w^2+Dw+D^2)^3 = \binom{3}{0}\binom{0}{0}w^6 + \binom{3}{2}\binom{2}{1}w^3D^3 + \binom{3}{3}\binom{3}{0}w^3D^3 +$$
$$+ \binom{3}{3}\binom{3}{3}D^6 = w^6 + 7D^3w^3 + D^6,$$

$$[w^2+(Dw+D^2)]^3 = w^6+3w^4(Dw+D^2) + 3w^2(Dw+D^2)^2 + (Dw+D^2)^3 =$$
$$= w^6+3Dw^5 + 3D^2w^4 + 3D^2w^4 + 6D^3w^3 +$$
$$+ 3w^2D^4 + D^3w^3 + 3D^4w^2 + 3D^5w + D^6.$$

The rational members of this sum are $w^6 + 6D^3w^3 + D^3w^3 + D^6$, as was cal-
culated above, with $w^3 = m = D^3+1$. The formula (4.8) is easily
applicable since there is no difficulty to solve the linear equations
$i+j = 3s$.

We shall still find the rational part of $e^6 = (w^2+Dw+D^2)^6$. By
formula (4.8), with

$$n = 2, \ s = 0,1,2,3,4; \ i+j = 3s, \ j \leq i \leq 6;$$
$$s = 0; \ i = j = 0;$$
$$s = 1; \ i = 3, \ j = 0,$$
$$i = 2, \ j = 1;$$
$$s = 2; \ i = 6, \ j = 0,$$
$$i = 5, \ j = 1,$$
$$i = 4, \ j = 2,$$
$$i = 3, \ j = 3;$$
$$s = 3; \ i = 6, \ j = 3,$$
$$i = 5, \ j = 4;$$
$$s = 4; \ i = 6, \ j = 6;$$

we obtain

$$\binom{6}{0}\binom{0}{0}w^{12} + [\binom{6}{3}\binom{3}{0} + \binom{6}{2}\binom{2}{1}]w^9D^3 +$$
$$+ [\binom{6}{6}\binom{6}{0} + \binom{6}{5}\binom{5}{1} + \binom{6}{4}\binom{4}{2} + \binom{6}{3}\binom{3}{3}]w^6D^6 +$$
$$+ [\binom{6}{6}\binom{6}{3} + \binom{6}{5}\binom{5}{4}]w^3D^9 + \binom{6}{6}\binom{6}{6}D^{12} =$$
$$= w^{12} + 50w^9D^3 + 141w^6D^6 + 50w^3D^9 + D^{12} =$$
$$= m^4 + 50m^3D^3 + 141m^2D^6 + 50mD^9 + D^{12},$$
$$m = D^3+1 = w^3.$$

We thus have the final result, viz. The rational part of $e^{3n} = (w^2+Dw+D^2)^{3n}$ equals

$$\sum_{\substack{i+j=3s \leq 6n \\ s=0,1,\ldots,2n \\ 0 \leq j \leq i \leq 3n}} \binom{3n}{i}\binom{i}{j}m^{2n-s}D^{3s}, \ m = D^3+1. \qquad\qquad (4.9)$$

We shall now find the coefficient of w in

$$\sum_{\substack{i=0 \\ j=0,1,\dots,i}}^{3n} \binom{3n}{i}\binom{i}{j}w^{6n-(i+j)}\, D^{i+j}$$

and demand, to this end,

$$\left.\begin{array}{l} 6n - (i+j) \equiv 1 \;(\mathrm{mod}\;3), \\[4pt] i+j \equiv 2(3),\; i+j = 3s+2 \\[4pt] s = 0,1,\dots,2n-1, \end{array}\right\} \quad (4.10)$$

and obtain thus, that this coefficient equals

$$\left.\begin{array}{l} \displaystyle\sum_{\substack{i+j=3s+2 \\ s=0,1,\dots,2n-1, \\ 0 \le j \le i \le 3n.}} \binom{3n}{i}\binom{i}{j}w^{6n-(3s+2)}\, D^{3s+2} \end{array}\right\} \quad (4.11)$$

But $w^{6n-(3s+2)} = w^{6n-(3s+3)+1} =$

$$= w^{3[2n-(s+1)]+1} = m^{2n-(s+1)}w,$$

$$m = w^3 = D^3+1.$$

Hence,

The coefficient of w in $(w^2+Dw+D^2)^{3n}$ equals

$$\left.\begin{array}{l} \displaystyle\sum_{\substack{i+j=3s+2; \\ s=0,1,\dots,2n-1 \\ 0 \le j \le i \le 3n}} D^{3s+2}\, m^{2n-s-1}\binom{3n}{i}\binom{i}{j}. \end{array}\right\} \quad (4.12)$$

Illustration of (4.12):

$n = 1;\; s = 0,1;\; s = 0;\; i = 2, j = 0;\; i = 1, j = 1;$
$\qquad\qquad s = 1;\; i = 3, j = 2.$

The coefficient of w in the expansion of $(w^2+Dw+D^2)^3$ equals

$$D^2 m\left[\binom{3}{2}\binom{2}{0} + \binom{3}{1}\binom{1}{1}\right] + D^5\left[\binom{3}{3}\binom{3}{2}\right] = 6D^2 + 3D^5,$$

as the reader can verify.

$n = 2;\; s = 0,1,2,3;\; 3n = 6 \ge i.$
$\qquad s = 0;\; i = 2,\; j = 0;\; i = 1,\; j = 1;$
$\qquad s = 1;\; i = 5,\; j = 0;\; i = 4,\; j = 1;\; i = 3,\; j = 2;$
$\qquad s = 2;\; i = 6,\; j = 1;\; i = 5,\; j = 2;\; i = 4,\; j = 3;$
$\qquad s = 3;\; i = 6,\; j = 5.$

The coefficient of w in $(w^2+Dw+D^2)^6$ equals

$$\left[\binom{6}{2}\binom{2}{0} + \binom{6}{1}\binom{1}{1}\right]D^2 m^3 + \left[\binom{6}{5}\binom{5}{0} + \binom{6}{1}\binom{1}{1}\right]D^5 m^2 +$$

$$+ \left[\binom{6}{6}\binom{6}{1} + \binom{6}{5}\binom{5}{2} + \binom{6}{4}\binom{4}{3}\right]D^8 m + \left[\binom{6}{0}\binom{6}{5}\right]D^{11} =$$

$$= 21D^2 m^3 + 12D^5 m^2 + 126D^8 m + 6D^{11}.$$

The reader will now prove without any difficulty that:

The coefficient of w^2 in $(w^2+Dw+D^2)^{3n}$ equals

$$\left.\sum_{\substack{i+j=3s+1;\\ s=0,1,\ldots,2n-1,\\ 0\le j\le i\le 3n}} \binom{3n}{i}\binom{i}{j}D^{3s+1}m^{2n-s-1}\right\}\quad(4.13)$$

But by (4.3) we have

$$(w^2+Dw+D^2)^{3n} = [A_0^{(3n)} + 2DA_0^{(3n+1)} + D^2A_0^{(3n+2)}] +$$
$$+ [A_0^{(3n+1)} + DA_0^{(3n+2)}]w + D^2A_0^{(3n+2)}w^2.$$

With (4.9), (4.12), (4.13) we obtain the identities

$$\left.\sum_{\substack{i+j=3s\le 6n\\ 0\le j\le i\le 3n}} \binom{3n}{i}\binom{i}{j}m^{2n-s}D^{3s} = A_0^{(3n)} + 2DA_0^{(3n+1)} + D^2A_0^{(3n+2)}.\right\}\quad(4.14)$$

$$\left.\sum_{\substack{i+j=3s+2\le 6n-1\\ 0\le j\le i\le 3n}} \binom{3n}{i}\binom{i}{j}D^{3s+2}m^{2n-s-1} = A_0^{(3n+1)} + DA_0^{(3n+2)}.\right\}\quad(4.14a)$$

$$\left.\sum_{\substack{i+j=3s+1\le 6n-2\\ 0\le j\le i\le 3n}} \binom{3n}{i}\binom{i}{j}D^{3s+1}m^{2n-s-1} = D^2A_0^{(3n+2)}.\right\}\quad(4.14b)$$

If we substitute in (4.14), (4.14a), (4.14b) the values of $A_0^{(3n)}$, $A_0^{(3n+1)}$, $A_0^{(3n+2)}$, we indeed arrive at some new combinatorial identities. We proceed to obtain further identities for the third dimension.

5. MORE IDENTITIES

We return to formula (4.2)

$$(w^2+Dw+D^2)^v = A_0^{(v)} + (w+2D)A_0^{(v+1)} + (w^2+Dw+D^2)A_0^{(v+2)},$$

and have with $(w-D)(w^2+Dw+D^2) = 1$,

$$(w-D)^v = \frac{1}{A_0^{(v)}+(w+2D)A_0^{(v+1)}+(w^2+Dw+D^2)A_0^{(v+2)}}.\quad(5.1)$$

We want to rationalize the denominator in (5.1) so that

$$[A_0^{(v)}+(w+2D)A_0^{(v+1)}+(w^2+Dw+D^2)A_0^{(v+2)}](a+bw+cw^2) = 1.\quad(5.2)$$

We obtain, with a,b,c rationals,

$$\left.\begin{array}{l}(A_0^{(v)}+2DA_0^{(v+1)}+D^2A_0^{(v+2)})a+mA_0^{(v+2)}b+(A_0^{(v+1)}+DA_0^{(v+2)})mc = 1,\\ (A_0^{(v+1)}+DA_0^{(v+2)})a+(A_0^{(v)}+2DA_0^{(v+1)}+D^2A_0^{(v+2)})b+mA_0^{(v+2)}c = 0,\\ A_0^{(v+2)}a+(A_0^{(v+1)}+DA_0^{(v+2)})b+(A_0^{(v)}+2DA_0^{(v+1)}+D^2A_0^{(v+2)})c = 0.\end{array}\right\}\quad(5.3)$$

The determinant of this system of equations (5.3) equals, with

$$x_v = A_0^{(v)} + 2DA_0^{(v+1)} + D^2 A_0^{(v+2)}; \quad y_v = A_0^{(v+1)} + DA_0^{(v+2)}; \quad z_v = A_0^{(v+2)};$$

$$\begin{vmatrix} x_v & mz_v & my_v \\ y_v & x_v & mz_v \\ z_v & y_v & x_v \end{vmatrix} = x_v^3 + my_v^3 + m^2 z_v^3 - 3mx_v y_v z_v = 1.$$

Hence we obtain from (5.3)

$$a = \begin{vmatrix} 1 & mz_v & my_v \\ 0 & x_v & mz_v \\ 0 & y_v & x_v \end{vmatrix} = x_v^2 - my_v z_v$$

$$b = \begin{vmatrix} x_v & 1 & my_v \\ y_v & 0 & mz_v \\ z_v & 0 & x_v \end{vmatrix} = mz_v^2 - x_v y_v$$

$$c = \begin{vmatrix} x_v & mz_v & 1 \\ y_v & x_v & 0 \\ z_v & y_v & 0 \end{vmatrix} = y_v^2 - x_v z_v.$$

Thus we have obtained the identity.

$$(w-D)^v = x_v^2 - my_v z_v + (mz_v^2 - x_v y_v)w + (y_v^2 - x_v z_v)w^2 \quad \text{or}$$

$$(w-D)^{3v} = x_{3v}^2 - m_{3v} z_{3v} + (mz_{3v}^2 - x_{3v} y_{3v})w + (y_{3v}^2 - x_{3v} z_{3v})w^2. \tag{5.4}$$

Expanding $(3-D)^{3v}$, we obtain, with $w^3 = m = (D^3 + 1)$

$$\left.\begin{aligned} (w-D)^{3v} &= \sum_{i=0}^{v} (-1)^i \binom{3v}{3i} m^{v-i} D^{3i} + \\ &+ \left(\sum_{i=0}^{v-1} (-1)^i \binom{3v}{3i+2} m^{v-1-i} D^{3i+2} \right) w + \\ &+ \left(\sum_{i=0}^{v-1} (-1)^{i+1} \binom{3v}{3i+1} m^{v-1-i} D^{3i+1} \right) w^2. \end{aligned}\right\} \tag{5.5}$$

With (5.4), (5.5) we obtain some new identities

$$\left.\begin{aligned} \sum_{i=0}^{v} (-1)^i \binom{3v}{3i} m^{v-i} D^{3i} &= x_{3v}^2 - my_{3v} z_{3v}; \\ \sum_{i=0}^{v-1} (-1)^i \binom{3v}{3i+2} m^{v-1-i} D^{3i+2} &= mz_{3v}^2 - x_{3v} y_{3v}; \\ \sum_{i=0}^{v-1} (-1)^{i+1} \binom{3v}{3i+1} m^{v-1-i} D^{3i+1} &= y_{3v}^2 - x_{3v} z_{3v}; \\ v = 0,1,\ldots; \quad x_v, y_v, z_v \text{ from } (4.4). \end{aligned}\right\} \tag{5.6}$$

Substituting for x_v, y_v, z_v the values from (4.4), and the values of $A^{(v)}$ from (0.11) the identities (5.6) take the form

6. FIFTH DEGREE DIOPHANTINE EQUATIONS

We return to formula (0.6) with $n = 5$, and obtain

$$\begin{vmatrix} A_0^{(n+4)} & A_0^{(n+5)} & A_0^{(n+6)} & A_0^{(n+7)} & A_0^{(n+8)} \\ A_1^{(n+4)} & A_1^{(n+5)} & A_1^{(n+6)} & A_1^{(n+7)} & A_1^{(n+8)} \\ A_2^{(n+4)} & A_2^{(n+5)} & A_2^{(n+6)} & A_2^{(n+7)} & A_2^{(n+8)} \\ A_3^{(n+4)} & A_3^{(n+5)} & A_3^{(n+6)} & A_3^{(n+7)} & A_3^{(n+8)} \\ A_4^{(n+4)} & A_4^{(n+5)} & A_4^{(n+6)} & A_4^{(n+7)} & A_4^{(n+8)} \end{vmatrix} \qquad (6.1)$$

$$= (-1)^{(5-1)(n+4)} = 1, \quad n = 0,1,\dots \ .$$

Substituting for $A_i^{(v)}$, $i = 1,2,3,4$; $v = n+4,\dots,n+8$; their representation as forms of $A_0^{(n+j)}$, $j = 0,1,2,3,4$, we obtain the matrix equality.

$$\begin{vmatrix} A_0^{(n+4)} & A_0^{(n+5)} & A_0^{(n+6)} & A_0^{(n+7)} & A_0^{(n+8)} \\ A_0^{(n+3)} & A_0^{(n+4)} & A_0^{(n+5)} & A_0^{(n+6)} & A_0^{(n+7)} \\ A_0^{(n+2)} & A_0^{(n+3)} & A_0^{(n+4)} & A_0^{(n+5)} & A_0^{(n+6)} \\ A_0^{(n+1)} & A_0^{(n+2)} & A_0^{(n+3)} & A_0^{(n+4)} & A_0^{(n+5)} \\ A_0^{(n)} & A_0^{(n+1)} & A_0^{(n+2)} & A_0^{(n+3)} & A_0^{(n+4)} \end{vmatrix} = 1. \qquad (6.2)$$

We denote

$$A_0^{(n+4)} = v, \quad A_0^{(n+3)} = u, \quad A_0^{(n+2)} = z, \quad A_0^{(n+1)} = y, \quad A_0^{(n)} = x \qquad (6.3)$$

and with formula (0.12), viz.

$$A_0^{(n+5)} = A_0^{(n)} + 5DA_0^{(n+1)} + 10D^2A_0^{(n+2)} + 10D^3A_0^{(n+3)} + 5D^4A_0^{(n+4)}.$$

We will also denote

$$5D = a_4, \quad 10D^2 = a_3, \quad 10D^3 = a_2, \quad 5D^4 = a_1,$$
$$(a_4 = b_1^{(0)}; \ a_3 = b_2^{(0)}; \ a_2 = b_3^{(0)}, \ a_1 = b_4^{(0)}). \qquad (6.4)$$

We then proceed as follows (in order to represent (6.2) as an expression in powers of x,y,z,u,v):

i) from the first row we subtract the a_1 multiple of the second row, then the a_2 multiple of the third row, then the a_3 multiple of the fourth row, then the a_4 multiple of the fifth row.

ii) from the second row we subtract the a_1 multiple of the third row, then the a_2 multiple of the fourth row, then the a_3 multiple of the fifth row.

iii) from the third row we subtract the a_1 multiple of the fourth row, then the a_2 multiple of the fifth row.

iv) from the fourth row we subtract the a_1 multiple of the fifth row,

and obtain, always applying formula (0.12) and the notations (6.3), (6.4);

$$\begin{vmatrix} v-a_1u-a_2z-a_3y-a_4x & x & y & z & u \\ u-a_1z-a_2y-a_3x & v-a_1u-a_2z-a_3y & x+a_4y & y+a_4z & z+a_4u \\ z-a_1y-a_2x & u-a_1z-a_2y & v-a_1u-z_2z & x-a_4y+a_3z & y-a_4z+a_3u \\ y-a_1x & z-a_1y & u-a_1z & v-a_1u & x+a_4y+a_3z+a_2u \\ x & y & z & u & v \end{vmatrix} = 1 \quad (6.5)$$

with the values of a_1, a_2, a_3, a_4 from (6.4), x,y,z,u,v from (6.3) where $n = 0,1,\ldots$. The expansion of the determinant (6.5) would yield the expression. Even with $D = 1$, it will still be very complicated. For $n = 0$, $x = 1$, $y = z = u = v = 0$, the determinant in (6.5) becomes

$$\begin{vmatrix} -a_4 & 1 & 0 & 0 & 0 \\ -a_3 & 0 & 1 & 0 & 0 \\ -a_2 & 0 & 0 & 1 & 0 \\ -a_1 & 0 & 0 & 0 & 1 \\ 1 & 0 & 0 & 0 & 0 \end{vmatrix} = 1,$$

and for $n = 1$, $u = z = y = x = 0$, $v = 1$, the determinant becomes

$$\begin{vmatrix} 1 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \end{vmatrix} = 1,$$

but these elementary determinants can hardly serve as a verification for formula (6.5). For $n = 2$ the test is also simple.

Let try for $n = 3$,

$$(A_0^{(3)}, A_0^{(4)}, A_0^{(5)}, A_0^{(6)}, A_0^{(7)}) = (0, 0, 1, a_1, a_2 + a_1^2) = (x,y,z,u,v):$$

$$\begin{vmatrix} a_2+a_1^2-a_1^2-a_2 & 0 & 0 & 1 & a_1 \\ a_1-a_1 & a_2+a_1^2-a_1^2-a_2 & 0 & a_4 & 1+a_1a_4 \\ 1 & a_1-a_1 & a_2+a_1^2-a_1^2-a_2 & a_3 & a_4+a_1a_3 \\ 0 & 1 & a_1-a_1 & a_2+a_1^2-a_1^2 & a_3+a_1a_2 \\ 0 & 0 & 1 & a_1 & a_2+a_1^2 \end{vmatrix} =$$

$$= \begin{vmatrix} 0 & 0 & 0 & 1 & a_1 \\ 0 & 0 & 0 & a_4 & 1+a_1a_4 \\ 1 & 0 & 0 & a_3 & a_4+a_1a_3 \\ 0 & 1 & 0 & a_2 & a_3+a_1a_2 \\ 0 & 0 & 1 & a_1 & a_2+a_1^2 \end{vmatrix} =$$

and subtracting the a_1 multiple of the fourth column from the fifth

$$= \begin{vmatrix} 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & a_4 & 1 \\ 1 & 0 & 0 & a_3 & a_4 \\ 0 & 1 & 0 & a_2 & a_3 \\ 0 & 0 & 1 & a_1 & a_2 \end{vmatrix} =$$

$$1 \cdot \begin{vmatrix} 0 & 0 & 1 & 0 \\ 0 & 0 & a_4 & 1 \\ 1 & 0 & a_2 & a_3 \\ 0 & 1 & a_1 & a_2 \end{vmatrix} = 1 \cdot \begin{vmatrix} 0 & 0 & 1 \\ 1 & 0 & a_3 \\ 0 & 1 & a_2 \end{vmatrix} = 1.$$

7. FIFTH DEGREE IDENTITIES

As we have seen, the ACF of the fixed vector

$$a^{(0)} = (w+4D, w^2+3Dw+6D^2, w^3+2Dw^2+3D^2w+4D^3, w^4+Dw^3+D^2w^2+D^3w+D^4)$$

is purely periodic with length of the primitive period $\ell = 1$. Hence we have the formula

$$\left. \begin{aligned} e^n &= (w^4+Dw^3+D^2w^2+D^3w+D^4)^n = \\ &\quad A_0^{(n)}+(w+4D)A_0^{(n+1)}+(w^2+3Dw+6D^2)A_0^{(n+2)} + \\ &\quad +(w^3+2Dw^2+3D^2w+4D^3)A_0^{(n+3)}+(w^4+Dw^3+D^2w^2+D^3w+D^4)A_0^{(n+4)}, \\ &\qquad n = 0,1,2,\dots \\ &\quad A_0^{(v)} \;(v = 5,6,\dots) \text{ from [1].} \end{aligned} \right\} \quad (7.1)$$

From (7.1) we obtain

$$\left. \begin{aligned} &(w^4+Dw^3+D^2w^2+D^3w+D^4)^{5n} = \\ &= A_0^{(5n)}+4DA_0^{(5n+1)}+6D^2A_0^{(5n+2)}+4D^3A_0^{(5n+3)}+D^4A_0^{(5n+4)} + \\ &\quad +(A_0^{(5n+1)}+3DA_0^{(5n+2)}+3D^2A_0^{(5n+3)}+D^3A_0^{(5n+4)})w + \\ &\quad +(A_0^{(5n+2)}+2DA_0^{(5n+3)}+D^2A_0^{(5n+4)})w^2 + \\ &\quad +(A_0^{(5n+3)}+DA_0^{(5n+4)})w^3+A_0^{(5n+4)}w^4. \end{aligned} \right\} \quad (7.2)$$

We shall now arrange $(w^4+Dw^3+D^2w^2+D^3w+D^4)^{5n}$ in descending powers of w. The first step will be to achieve this arrangement in powers of w^{5s},

$s = 0,1,2,3,\ldots,4n$, since the highest power of w in that expression is w^{20n}, so we look for the rational part of it. We have by the multi-nomial theorem

$$(w^4+Dw^3+D^2w^2+D^3w+D^4)^{5n} =$$

$$\left. \sum_{\substack{4y_1+3y_2+2y_3+y_4=k \\ y_2+2y_3+3y_4+4y_5=20n-k,k=0,1,\ldots,20n}} \binom{y_1+y_2+y_3+y_4+y_5}{y_1,y_2,y_3,y_4,y_5} w^{4y_1+3y_2+2y_3+y_4} \cdot D^{y_2+2y_3+3y_4+4y_5} \right\} \quad (7.3)$$

since the sum of the exponents of w and D in the above expansion equals $20n = k + (20n-k)$. We also have from (7.3)

$$4y_1+4y_2+4y_3+4y_4+4y_5 = 20n$$

$$y_1 + y_2 + y_3 + y_4 + y_5 = 5n. \qquad (7.4)$$

Since we are looking for 5-multiples of the exponents of w — hence also of D — we obtain from (7.3), (7.4):

$$\left. \begin{array}{l} \text{The rational part in the expansion of} \\ (w^4+Dw^3+D^2w^2+D^3w+D^4)^{5n} \text{ equals} \\[2mm] \displaystyle\sum_{\sum_{i=1}^{4}(5-i)y_i=5s \le 20n} \binom{5n}{y_1,y_2,y_3,y_4,y_5} m^s D^{20n-5s} \\[4mm] \qquad\qquad s \ge 0, \ m = w^5 = (D^5+1). \end{array} \right\} \quad (7.5)$$

The equation $y_2+2y_3+3y_4+4y_5 = 20n-5s$ follows from $y_1+y_2+y_3+y_4+y_5 = 5n$ in the multinomial coefficient.

As an illustration to (7.5) we shall find the rational part in the expansion of $(w^4+Dw^3+D^2w^2+D^3w+D^4)^5$, $n = 1$. We obtain from (7.5) that this equals

$$\sum_{\sum_{i=1}^{4}(5-i)y_i=5s \le 20} \binom{5}{y_1,y_2,y_3,y_4,y_5} m^s D^{20-5s} \qquad (7.6)$$

We solve the equations, $s = 0,1,2,3,4$

$$s = 0; \ 4y_1+3y_2+2y_3+y_4 = 0, \ y_1+y_2+y_3+y_4+y_5 = 5$$

$$y_1 = y_2 = y_3 = y_4 = 0, \ y = 5.$$

The corresponding member in (7.6) equals

$$\binom{5}{5} m^0 D^{20-0} = \underline{D^{20}}.$$

$s = 1$; $4y_1 + 3y_2 + 2y_3 + y_4 = 5$, $y_1 + y_2 + y_3 + y_4 + y_5 = 5$

$y_1 = y_4 = 1$; $y_2 = y_3 = 0$; $y_5 = 3$.

$y_1 = 0$; $y_2 = y_3 = 1$; $y_4 = 0$; $y_5 = 3$

$y_1 = 0$; $y_2 = 1$; $y_3 = 0$; $y_4 = 2$; $y_5 = 2$

$y_1 = y_2 = 0$; $y_3 = 1$; $y_4 = 3$; $y_5 = 1$

$y_1 = y_2 = 0$; $y_3 = 2$; $y_4 = 1$; $y_5 = 2$

$y_1 = y_2 = y_3 = y_5 = 0$; $y_4 = 5$.

The corresponding member in (7.6) equals

$$\left[\binom{5}{1,1,0,0,3} + \binom{5}{0,1,1,0,3} + \binom{5}{0,1,0,2,2} + \binom{5}{0,0,1,3,1} + \right.$$

$$\left. \binom{5}{0,0,2,1,2} + \binom{5}{0,0,0,0,5} \right] mD^{15} = \underline{121\ mD^{15}}.$$

$s = 2$; $4y_1 + 3y_2 + 2y_3 + y_4 = 10$; $y_1 + y_2 + y_3 + y_4 + y_5 = 5$.

We shall write $(y_1, y_2, y_3, y_4, y_5)$ for the solution of the above linear equations.

$(2,0,1,0,2)$; $(2,0,0,2,1)$; $(1,2,0,0,2)$;

$(1,1,1,1,1)$; $(0,3,0,1,1)$; $(0,2,2,0,1)$;

$(0,1,3,1,0)$; $(0,2,1,2,0)$; $(0,1,3,1,0)$;

$(0,0,5,0,0)$; $(1,0,3,0,1)$; $(1,0,2,2,0)$.

The corresponding member in (7.6) equals

$$\left[\binom{5}{2,0,1,0,2} + \binom{5}{2,0,0,2,1} + \binom{5}{1,2,0,0,2} + \binom{5}{1,1,1,1,1} + \right.$$

$$+ \binom{5}{0,3,0,1,1} + \binom{5}{0,2,2,0,1} + \binom{5}{0,1,3,1,0} + \binom{5}{0,2,1,2,0} +$$

$$\left. + \binom{5}{0,1,3,1,0} + \binom{5}{0,0,5,0,0} + \binom{5}{1,0,3,0,1} + \binom{5}{1,0,2,2,0} \right] =$$

$$= (30 + 30 + 30 + 120 + 20 + 30 + 20 + 30 + 20 + 1 + 20 + 30) m^2 D^{10} =$$

$$= \underline{381\ m^2 D^{10}}.$$

$s = 3$; $4y_1 + 3y_2 + 2y_3 + y_4 = 15$; $y_1 + y_2 + y_3 + y_4 + y_5 = 5$.

$(3,1,0,0,1)$; $(2,2,0,1,0)$; $(3,0,1,1,0)$;

$(2,1,2,0,0)$; $(1,3,1,0,0)$; $(0,5,0,0,0)$.

The corresponding members in (7.6) equals

$$\left[\binom{5}{3,1,0,0,1} + \binom{5}{2,2,0,1,0} + \binom{5}{3,0,1,1,0} + \binom{5}{2,1,2,0,0} + \right.$$

$$\left. + \binom{5}{1,3,1,0,0} + \binom{5}{0,5,0,0,0} \right] m^3 D^5 =$$

$$= (20 + 30 + 20 + 30 + 20 + 1) m^3 D^5 = \underline{121\ m^3 D^5}.$$

$s = 4$; $4y_1 + 3y_2 + 2y_3 + y_4 = 20$; $y_1 + y_2 + y_3 + y_4 + y_5 = 5$.

The only solution is $(5,0,0,0,0)$ and the corresponding member in (7.6) equals

$$\binom{5}{5,0,0,0,0} m^4 = \underline{m^4}.$$

Thus the formula (7.5) yields, for $n = 1$, the sum

$$m^4 + 121 \, m^3 D^5 + 381 \, m^2 D^{10} + 121 \, m D^{15} + D^{20}. \tag{7.7}$$

From the other side we have

$$\left. \begin{aligned}
(w^4 + Dw^3 + D^2 w^2 + D^3 w + D^4)^5 &= \\
= w^{20} &+ 5w^{19}D + 15w^{18}D^2 + 35w^{17}D^3 + 70w^{16}D^4 + \\
&+ 121w^{15}D^5 + 185w^{14}D^6 + 255w^{13}D^7 + 320w^{12}D^8 + \\
&+ 365w^{11}D^9 + 381D^{10}w^{10} + 365w^9 D^{11} + 320w^8 D^{12} + \\
&+ 255w^7 D^{13} + 185w^6 D^{14} + 121w^5 D^{15} + 70w^4 D^{16} + \\
&+ 35w^3 D^{17} + 15w^2 D^{18} + 5w D^{19} + D^{20}.
\end{aligned} \right\} \tag{7.8}$$

That the expansion in (7.8) is symmetric (the coefficients of $w^i D^{20-i}$ and $w^{20-i} D^i$, $i = 0,1,\ldots,20$, are equal) is clear. The rational part equals

$$w^{20} + 121w^{15}D^5 + 381w^{10}D^{10} + 121w^5 D^{15} + D^{20} =$$
$$= m^4 + 121m^3 D^5 + 381m^2 D^2 + 121mD^{15} + D^{20}$$

as should be by (7.7).

Comparing formulas (7.2) with (7.5), we obtain the identity

$$\left. \begin{aligned}
\sum_{0 \le \sum_{i=1}^{4} (5-i)y_i = 5s \le 20n} \binom{5n}{y_1,y_2,y_3,y_4,y_5} m^s D^{20n-5s} &= \sum_{i=0}^{4} \binom{4}{i} D^i A_0^{(5n+i)}. \\
&\qquad n = 1,2,\ldots; \; A_0^{(v)} \text{ from } (7.6), \; v = 5,6,\ldots .
\end{aligned} \right\} \tag{7.9}$$

Substitution of the values of $A_0^{(v)}$ from (7.6) in (7.9) would yield a new expression for (7.9). The reader can prove the statements:

The coefficients of w in the expansion of $(w^4 + Dw^3 + D^2 w^2 + D^3 w + D^4)^{5n}$ equals

$$\left. \begin{aligned}
\sum_{\sum_{i=1}^{4} (5-i)y_i = 5s+1 \le 20n} \binom{5n}{y_1,y_2,y_3,y_4,y_5} m^s D^{20n-5s-1} \\
s = 0,1,\ldots,4n-1.
\end{aligned} \right\} \tag{7.10}$$

Furthermore, the coefficients of w^i in the expansion of $(w^4 + Dw^3 + D^2 w^2 + D^3 w + D^4)^{5n}$ equal, with $i = 0,1,2,3,4$,

$$\sum_{\substack{i \le \sum_{i=1}^{4} (5-i)y_i = 5s+i \le 20n}} \binom{5n}{y_1,y_2,y_3,y_4,y_5} m^s D^{20n-5s-i} \left.\rule{0cm}{1.5cm}\right\} \quad (7.11)$$

$$s = 0,1,\ldots,4n-1, \quad i = 0,1,\ldots,4.$$

Comparing (7.2) with (7.11) we have finally the five identities,

$$\left.\begin{aligned}\sum_{\substack{i \le \sum_{j=0}^{4} (5-j)y_j = 5s+i \le 20n}} \binom{5n}{y_1,y_2,y_3,y_4,y_5} m^s D^{20n-5s-i} &= \\ = \sum_{j=0}^{4-i} \binom{4-i}{j} D^j A_0^{(5n+i+j)} \end{aligned}\right\} \quad (7.12)$$

$$i = 0,1,2,3,4.$$

We shall give a verification for formula (7.12) with $i = 0$, formula (7.9), $D = 1$, $n = 1$; we have $m = D^3+1 = 2$, $A_0^{(0)} = 1$, $A_0^{(1)} = A_0^{(2)} = A_0^{(3)} = A_0^{(4)} = 0$, $A_0^{(n+5)} = A_0^{(n)} + 5A_0^{(n+1)} + 10A_0^{(n+2)} + 10A_0^{(n+3)} + 5A_0^{(n+4)}$, $A_0^{(5)} = 1$, $A_0^{(6)} = 5$, $A_0^{(7)} = 35$, $A_0^{(8)} = 235$, $A_0^{(9)} = 1580$.

This yields

$$16 + 121 \cdot 8 + 381 \cdot 4 + 121 \cdot 2 + 1 = 1 + 20 + 210 + 940 + 1580 = 2751.$$

It is also easy to verify the identities (7.12) for $n = 2$.

8. MORE ABOUT UNITS AND IDENTITIES

Since $w^5 - D^5 = (w-D)(w^4+Dw^3+D^2w^2+D^3w+D^4) = 1$, we have also, $(w^5 = D^5+1)$

$$e^{-v} = (w-D)^v = \frac{1}{(w^4+Dw^3+D^2w^2+D^3w+D^4)^4},$$

and with formula (7.2), and setting $v = 5n$,

$$(w-D)^{5n} = \frac{1}{a_5 + a_4 w + a_3 w^2 + a_2 w^3 + a_1 w^4}$$

$$a_{5-i} = \sum_{j=0}^{4-i} \binom{4-i}{j} D^j A_0^{(5n+i+j)}, \quad i=0,\ldots,4 \quad \text{(from (7.12))}.$$

(8.1)

We shall now rationalize the denominator in (8.1) and demand

$$1 = (a_5 + a_4 w + a_3 w^2 + a_2 w^3 + a_1 w^4)(c_1 + c_2 w + c_3 w^2 + c_4 w^3 + c_5 w^5). \qquad (8.2)$$

Expanding (8.2), with $m = w^5 = D^5 + 1$, we obtain

$$a_5 c_1 + m a_1 c_2 + m a_2 c_3 + m a_3 c_4 + m a_4 c_5 = 1$$
$$a_4 c_1 + a_5 c_2 + m a_1 c_3 + m a_2 c_4 + m a_3 c_5 = 0$$
$$a_3 c_1 + a_4 c_2 + a_5 c_3 + m a_1 c_4 + m a_2 c_5 = 0$$
$$a_2 c_1 + a_3 c_2 + a_4 c_3 + a_5 c_4 + m a_1 c_5 = 0$$
$$a_1 c_1 + a_2 c_2 + a_3 c_3 + a_4 c_4 + a_5 c_5 = 0.$$

(8.3)

The determinant of the system of linear equations (8.3) equals, inter-changing columns with rows,

$$\Delta = \begin{vmatrix} a_5 & a_4 & a_3 & a_2 & a_1 \\ m a_1 & a_5 & a_4 & a_3 & a_2 \\ m a_2 & m a_1 & a_5 & a_4 & a_3 \\ m a_3 & m a_2 & m a_1 & a_5 & a_4 \\ m a_4 & m a_3 & m a_2 & m a_1 & a_5 \end{vmatrix}. \qquad (8.4)$$

Now, the reader will verify that the field equation of $e^{5n} = a_5 + a_4 w + a_3 w^2 + a_2 w^3 + a_1 w^4$ has exactly the free element $=1$, since e is a unit, as in case $n = 3$. We thus obtain

$$(w-D)^{5n} = c_1 + c_2 w + c_3 w^2 + c_4 w^3 + c_5 w^4. \qquad (8.5)$$

Expanding $(w-D)^{5n}$ we obtain the result. The rational part in the expansion of (8.5) equals

$$\sum_{i=0}^{n} (-1)^i D^{5i} w^{5n-5i}. \qquad (8.6)$$

Comparing (8.6) with c_1 and calculating c_1 from (8.3), (8.4), we obtain the identity, with $w^5 = m = D^5 + 1$

$$\sum_{i=0}^{n}(-1)^i\binom{i}{}D^{5i}m^{n-i}=\begin{vmatrix} a_5 & a_4 & a_3 & a_2 \\ ma_1 & a_5 & a_4 & a_3 \\ ma_2 & ma_1 & a_5 & a_4 \\ ma_3 & ma_2 & ma_1 & a_5 \end{vmatrix}. \tag{8.7}$$

We substitute the values of a_i, $i = 1,\ldots,5$; from (8.1) and obtain

$$\sum_{i=0}^{n}(-1)^i\binom{i}{}D^{5i}m^{n-i}=$$

$$\begin{vmatrix} \sum_{j=0}^{4}\binom{4}{j}D^jA_0(5n+j) & \sum_{j=0}^{3}\binom{3}{j}D^jA_0(5n+1+j) & \sum_{j=0}^{2}\binom{2}{j}D^jA_0(5n+2+j) & \sum_{j=0}^{1}\binom{1}{j}D^jA_0(5n+3+j) \\ mA_0(5n+4) & \sum_{j=0}^{4}\binom{4}{j}D^jA_0(5n+j) & \sum_{j=0}^{1}\binom{1}{j}D^jA_0(5n+3+j) & \sum_{j=0}^{2}\binom{2}{j}D^jA_0(5n+2+j) \\ m\sum_{j=0}^{1}\binom{1}{j}D^jA_0(5n+3+j) & mA_0(5n+4) & \sum_{j=0}^{4}\binom{4}{j}D^jA_0(5n+j) & \sum_{j=0}^{3}\binom{3}{j}D^jA_0(5n+1+j) \\ m\sum_{j=0}^{2}\binom{2}{j}D^jA_0(5n+2+j) & m\sum_{j=0}^{1}\binom{1}{j}D^jA_0(5n+3+j) & mA_0(5n+4) & \sum_{j=0}^{4}\binom{4}{j}D^jA_0(5n+j) \end{vmatrix} \tag{8.8}$$

Comparing the powers of w^i ($i = 1,2,3,4$) on both sides of (8.5) we obtain four more identities with c_i ($i = 2,3,4,5$) calculated from the system (8.3). To have a complete view of (8.8) the values of $A_0(5n+i)$, ($i = 0,1,2,3,4$) will have to be substituted from (7.6). This would yield very complicated expressions.

Let us only limit at the difficulties of writing out in full — but not calculating — the determinant (8.8) in a simple case at $D = n = 1$. We have for the left side of (8.8)

$$\sum_{i=0}^{1} (-1)^i D^{5i} m^{n-i} = m - D^5 = 1.$$

For the right side we calculate

$$A_0^{(5)} = 1, \ A_0^{(6)} = 5, \ A_0^{(7)} = 35, \ A_0^{(8)} = 235, \ A_0^{(9)} = 1580.$$

Thus the determinant (8.8) becomes, with the values from (8.1), viz.

$$a_5 = \sum_{j=0}^{4} \binom{4}{j} A_0^{(5+j)} = 1 + 4 \cdot 5 + 6 \cdot 35 + 4 \cdot 235 + 1580 = 2751,$$

$$a_4 = \sum_{j=0}^{3} \binom{3}{j} A_0^{(6+j)} = 5 + 3 \cdot 35 + 3 \cdot 235 + 1580 = 2395,$$

$$a_3 = \sum_{j=0}^{2} \binom{2}{j} A_0^{(7+j)} = 35 + 2 \cdot 235 + 1580 = 2085,$$

$$a_2 = \sum_{j=0}^{1} \binom{1}{j} A_0^{(8+j)} = 235 + 1580 = 1815,$$

$$a_1 = \sum_{j=0}^{0} \binom{0}{j} A_0^{(9+j)} = 1580, \quad m = 2,$$

$$\begin{vmatrix} 2751 & 2395 & 2085 & 1815 \\ 3160 & 2751 & 2395 & 2085 \\ 3630 & 3160 & 2751 & 2395 \\ 4170 & 3630 & 3160 & 2751 \end{vmatrix} = 1.$$

Thus formula (8.8) has been verified for $D = n = 1$. The entries in the right hand determinant become a challenge for $n, D > 1$.

On the combined subject of this paper about "Diophantine Equations, Units and Identities" there is not much literature, but I cannot finish without naming the literature in each of the three above mentioned subjects without indicating at the very end, some papers which have been most useful in my paper.

Special Issue on
Intelligent Computational Methods for Financial Engineering

Call for Papers

As a multidisciplinary field, financial engineering is becoming increasingly important in today's economic and financial world, especially in areas such as portfolio management, asset valuation and prediction, fraud detection, and credit risk management. For example, in a credit risk context, the recently approved Basel II guidelines advise financial institutions to build comprehensible credit risk models in order to optimize their capital allocation policy. Computational methods are being intensively studied and applied to improve the quality of the financial decisions that need to be made. Until now, computational methods and models are central to the analysis of economic and financial decisions.

However, more and more researchers have found that the financial environment is not ruled by mathematical distributions or statistical models. In such situations, some attempts have also been made to develop financial engineering models using intelligent computing approaches. For example, an artificial neural network (ANN) is a nonparametric estimation technique which does not make any distributional assumptions regarding the underlying asset. Instead, ANN approach develops a model using sets of unknown parameters and lets the optimization routine seek the best fitting parameters to obtain the desired results. The main aim of this special issue is not to merely illustrate the superior performance of a new intelligent computational method, but also to demonstrate how it can be used effectively in a financial engineering environment to improve and facilitate financial decision making. In this sense, the submissions should especially address how the results of estimated computational models (e.g., ANN, support vector machines, evolutionary algorithm, and fuzzy models) can be used to develop intelligent, easy-to-use, and/or comprehensible computational systems (e.g., decision support systems, agent-based system, and web-based systems)

This special issue will include (but not be limited to) the following topics:

- **Computational methods**: artificial intelligence, neural networks, evolutionary algorithms, fuzzy inference, hybrid learning, ensemble learning, cooperative learning, multiagent learning

- **Application fields**: asset valuation and prediction, asset allocation and portfolio selection, bankruptcy prediction, fraud detection, credit risk management

- **Implementation aspects**: decision support systems, expert systems, information systems, intelligent agents, web service, monitoring, deployment, implementation

Authors should follow the Journal of Applied Mathematics and Decision Sciences manuscript format described at the journal site http://www.hindawi.com/journals/jamds/. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at http://mts.hindawi.com/, according to the following timetable:

Manuscript Due	December 1, 2008
First Round of Reviews	March 1, 2009
Publication Date	June 1, 2009
