TITLE

Macintosh Computers: ROM Version Numbers

ArticleID: 2532

Created: 13 Feb 1988

Modified: 07 Oct 1999

TOPIC

How do I determine the ROM version of my Macintosh computer?

DISCUSSION

To find the ROM revision of a computer not listed in this article, use one of the following two described methods.

Apple System Profiler is the easiest. Launch the program and under the System Profile tab, look in the Production information section for the ROM revision.

Alternatively, you can use the Programmer's Interrupt Switch to determine the ROM version number of your Macintosh Computer.

Press the programmer's interrupt switch, or use the keyboard equivalent.

Type: DM 2AE

Press return.

This displays the ROMbase global which is located at memory address \$0002AE. The ROMbase global is the number located in offset 0 and 2. For example, a Quadra 660AV displays: 4080 0000 XXXX XXXX XXXX XXXX XXXX XXXX

Type the ROMbase global. EXAMPLE: DM 40800000. The result is 5BF1 0FD1 0000 002A 077D XXXX XXXX XXXX

The machine type and ROM version are at offset 8 or 077D in this case which is from a 660av Macintosh Computer. You could also add the 8 bytes to the memory address and have done DM 40800008 and the first two bytes would be the type and ID.

Macintosh ROM Version Table

System Machine Type ROM version

Macintosh 128K 00
Macintosh 512K 00

Power Macintosh 8600 Series 07 7D

Power Macintosh 9500 Series 07 7D
Power Macintosh 9600 Series 07 7D

NOTES:

The ROM version does not necessarily reflect slight differences in ROM sets. For example, the Macintosh IIfx ROMs are slightly different from the Macintosh IIfx ROMs, even though the ROM version number is the same.

With the Centris 660AV and Quadra 840AV, a new 2 MB ROM was introduced.
